Alberty, 2006-03-31 Navigate the complexities of biochemical thermodynamics with Mathematica. Chemical reactions are studied under the constraints of constant temperature and constant pressure; biochemical reactions are studied under the additional constraints of pH and perhaps pMg or free concentrations of other metal ions. As more intensive variables are specified, more thermodynamic properties of a system are defined, and the equations that represent thermodynamic properties as a function of independent variables become more complicated. This sequel to Robert Alberty's popular *Thermodynamics of Biochemical Reactions* describes how researchers will find Mathematica a simple and elegant tool which makes it possible to perform complex calculations that would previously have been impractical. *Biochemical Thermodynamics: Applications of Mathematica* provides a comprehensive and rigorous treatment of biochemical thermodynamics using Mathematica to practically resolve thermodynamic issues. Topics covered include: Thermodynamics of the dissociation of weak acids; Apparent equilibrium constants; Biochemical reactions at specified temperatures and various pHs; Uses of matrices in biochemical thermodynamics; Oxidoreductase, transferase, hydrolase, and lyase reactions; Reactions at 298.15 K; Thermodynamics of the binding of ligands by proteins; Calorimetry of biochemical reactions. Because Mathematica allows the intermingling of text and calculations, this book has been written in Mathematica and includes a CD-ROM containing the entire book along with macros that help scientists and engineers solve their particular problems. **Physical Chemistry, SI Version** Robert A.
