

Moon Note-Taking Guide

Why do we see the same face of the moon?

Because the moon rotates around its axis at the same rate that it orbits Earth, we always see the same side of the moon. This is called synchronous rotation. The moon's rotation period is 27.3 days, and its orbital period is 27.3 days. This is a result of the fact that the moon's rotation and orbit are locked together. The moon's rotation is synchronous with its orbit, so we always see the same side of the moon.

Why does the moon have craters?

The moon has many craters because it has been hit by many objects over its long history. The moon's surface is covered in craters of various sizes, from small pebbles to large basins. The craters are formed by the impact of objects on the moon's surface. The moon's surface is covered in craters of various sizes, from small pebbles to large basins.
