

Physical Science Module 2 Review Paper

Unit 1 Review

- As a wave travels through a medium, it transports energy but does not transport matter in the direction of the wave.
- Transverse waves are waves in a direction perpendicular to the direction of wave travel. Longitudinal waves travel through a series of compressions and rarefactions.
- Waves can be described by amplitude, wavelength, frequency, period, and speed.
- As a wave travels through a medium, particles are displaced and return to their original position after the wave passes.
- Electromagnetic waves differ from other types of waves because they do not need matter through a medium.
- A wavelength is the distance between two consecutive compressions or rarefactions.
- Given the distance between two consecutive compressions or rarefactions and the time it takes for one compression to pass a point, you can calculate the wavelength.
- As wavelength is given frequency, you can find the period of a wave by using period = 1/frequency.
- Speed is distance through a medium, divided by the time it takes for a wave to travel. The speed of a wave is the same as the speed of the medium it is traveling through. This type of wave is a longitudinal wave.
- Because the particles move parallel to the direction of wave travel, it is called a longitudinal wave.

Unit 2 Assignment Questions

Question	Answer
What type of waves can only travel through matter as medium?	Waves that travel through matter as medium are called <u>mechanical waves</u> .
What is period?	Period is the <u>time</u> it takes for one full cycle of a wave to pass a point.
What is the relationship between amplitude and period?	If the amplitude of a wave is large, the period is also large. The period of a wave is directly proportional to the amplitude.
How does the type of medium affect a wave?	The type of medium affects the <u>speed</u> of a wave. The speed of a wave is directly proportional to the type of medium it is traveling through.
Describe the relationship between frequency and wavelength.	The frequency of a wave is <u>inversely proportional</u> to the wavelength. As the frequency of a wave increases, the wavelength decreases.
