Discussion The authors of this paper have shown that the use of a single, standard, non-validated questionnaire to assess the prevalence of mental health problems in a community sample is likely to produce a high prevalence rate. This is because the questionnaire used was not designed to detect mental health problems, but rather to assess the prevalence of mental health problems. ► *Chlorophyllin* is a water-soluble derivative of chlorophyll. It is used to treat jaundice, a condition in which the liver is unable to process bilirubin, a yellow pigment that builds up in the blood. Chlorophyllin is also used to treat constipation and to relieve the itching and burning associated with hemorrhoids. It is also used to treat the skin condition known as psoriasis. Chlorophyllin is a natural product and is generally considered safe. However, it can cause side effects such as nausea, vomiting, and diarrhea. It can also interact with certain medications, so it is important to consult with a doctor before taking it.

QUESTION *My 10-year-old son has been diagnosed with a urinary tract infection. He has been taking antibiotics for 5 days, but he still has a fever and is still uncomfortable. What should I do?*

ANSWER Urinary tract infections (UTIs) are common in children, and they can be caused by a variety of bacteria. The most common cause is *Escherichia coli*, which is a bacterium that is found in the digestive tract of many people. UTIs can be treated with antibiotics, but it is important to make sure that the child is taking the medication correctly and for the full course of treatment. If the child's fever and discomfort persist after 5 days of treatment, it is important to contact the doctor who prescribed the antibiotics. The doctor may want to do a urine culture to see if the bacteria have responded to the antibiotics. If the bacteria are still present, the doctor may want to change the antibiotic. It is also important to make sure that the child is drinking plenty of fluids and is voiding frequently. This will help to flush the bacteria out of the urinary tract.

1. **Identify the main components of the system.** The system consists of a client application, a server application, and a database.

2. **Describe the architecture of the system.** The system is a client-server architecture. The client application is responsible for user interaction and data entry. The server application is responsible for processing requests and managing the database. The database is responsible for storing and retrieving data.

3. **Explain the data flow between the components.** The client application sends requests to the server application. The server application processes the requests and sends responses back to the client application. The server application also interacts with the database to store and retrieve data.

4. **Discuss the security requirements of the system.** The system must ensure the confidentiality, integrity, and availability of the data. This requires implementing security measures such as user authentication, access control, and data encryption.

5. **Outline the testing strategy for the system.** The testing strategy should include unit testing, integration testing, and system testing. Unit testing is used to verify the correctness of individual components. Integration testing is used to verify the correctness of the interactions between components. System testing is used to verify the correctness of the entire system.

QUESTION
 A 60-year-old male with a 10-year history of type 2 diabetes mellitus presents with a 2-week history of increasing fatigue, weight loss, and decreased appetite. He reports frequent urination and increased thirst. His medical history is significant for hypertension, hyperlipidemia, and chronic kidney disease (stage 3). He is currently taking metformin, lisinopril, and atorvastatin. His last hemoglobin A1c was 8.5% 3 months ago. Physical examination reveals mild dehydration, tachycardia, and normal bowel sounds. Laboratory studies show a serum glucose of 250 mg/dL, serum bicarbonate of 18 mEq/L, and a negative urine ketone test. What is the most likely cause of his symptoms?

ANSWER
 A. Hypokalemia
 B. Hyperkalemia
 C. Metabolic acidosis
 D. Metabolic alkalosis
 E. Respiratory acidosis

EXPLANATION
 The patient's symptoms and laboratory findings are consistent with metabolic acidosis. The increased fatigue, weight loss, and decreased appetite are non-specific symptoms that can be seen in various conditions. The frequent urination and increased thirst are suggestive of hyperglycemia. The serum glucose level of 250 mg/dL is elevated, but the negative urine ketone test makes diabetic ketoacidosis unlikely. The serum bicarbonate level of 18 mEq/L is low, indicating metabolic acidosis. The patient's history of type 2 diabetes mellitus and chronic kidney disease (stage 3) are the most likely causes of his symptoms. Metabolic acidosis can result from a variety of causes, including renal failure, lactic acidosis, and certain medications. In this case, the patient's chronic kidney disease is the most likely cause of his metabolic acidosis. The patient's tachycardia and mild dehydration are also consistent with metabolic acidosis.
