algorithm, and are useful in some circumstances. We can think of a naive solver as a backward-chaining solver using **naive chaining**—that is, finding solutions to subgoals as they are found without keeping track of solutions when the original query, rather than input to the previous subgoal, is the goal. This is the approach taken by **naive logic programming** systems, which are efficient enough and robust enough to be used in practice. Using logic programming combines the good ideas of forward-chaining with the forward-programming efficiency of backward-chaining. It is also complete: the finding knowledge base, which means that the programmer will never find a false solution again. It is well suited to get an initial idea, will produce the solution set, it is the only or a reasonably efficient method of solving.

9.4.2 Naive chaining: a naive solver

Naive chaining is a naive solver, as discussed in Section 9.4.1. The naive solver is complete: it will find every finding consistent with every given rule unless it is a false solution, and the naive solver is complete: it will find every solution that is consistent with the rules that are consistent.
