

5-1 Charging System

The 250, 350 series electrical system use an alternator to generate voltage which is then rectified to direct current. These direct current voltage are controlled by a voltage regulator which is set to maintain a 12-15V DC constant.

When the engine is stopped, DC current to energize the lighting and ignition circuits is supplied by the BATTERY circuit. When the engine is running, excess voltage is shunted to the battery, if necessary, for recharging. If unneeded, the voltage regulator will decrease alternator current output.
