

Rate of Reaction

What is the speed of a reaction measured?

Why?

Chemical reactions occur at different speeds. Some are ultrafast (explosions), others very slow. For example, you can leave sodium in your kitchen-drawers open overnight without it reacting depending on the conditions. In order to study reactions that change the speed of a reaction, we must develop ways of measuring at how the rate of reaction is measured during a reaction.

Model 1 -- Concentration versus Time Graphs

- The graph in Model 1. How does the concentration of a specific chemical species change over time?
 - When and in the concentration increased?
(No concentration is concentrated nothing)
 - When and in, the time increased?
(The time is increasing over)
- Consider the data in Model 1:
 - What specific concentration of the species when the chemical reaction was initiated?
(The initial concentration of the chemical species in the reaction was 0.100M)
 - Did the concentration of the species increase or decrease over time?
(The concentration of the chemical species decreased over time)
 - Was the species a reactant or product in the reaction? Justify your reasoning.
(The chemical species was a reactant because it was used up during the reaction. Its concentration went down)
