Mental Practice: Clinical and Experimental Research in Imagery and Action Observation Magdalena Ietswaart, Andrew J. Butler, Philip L.

Jackson, Martin Gareth Edwards, 2016-05-18 There is now strong evidence demonstrating that the brain simulates action and other functions. Such action simulation can be evoked through conscious mental rehearsal of movement or imagery but also through passive action observation watching movements in others. Furthermore, there is evidence to suggest that mental rehearsal of movement or mental practice can produce improvements normally attributed to practising actual movements. It is currently assumed that such improvements are due to neural activation associated with action simulation. However, the neuroscience of mental practice efficacy is still poorly understood. The aim of this research topic is to clarify the underlying mechanisms of mental practice, bringing evidence from cognitive neuroscience, experimental neuropsychology, sport and movement science, and clinical neurology. It also attempts to address confusion regarding the concepts of imagery and observation, which has hampered the progression of mental practice research, both scientifically and applied. As well as reviews, theoretical and position articles, this research topic includes original neuroimaging, experimental, and patient research addressing, among others, the following issues: Neuroimaging studies provide strong evidence for action simulation, but the link to behavioural change and functional outcome is weak. What is the evidence that mental practice efficacy is driven by neuroplasticity processes evoked by action simulation? This research topic includes contributions on neural correlates and behaviour with regards to imagery and action observation. Much of the mental practice efficacy evidence comes from longstanding research within sport science. However, what does mental practice entail in these contexts, and to what extent is it compatible with the cognitive neuroscience perspective of action simulation? This research topic will include contributions that consider both evidence and concepts with regards to imagery and action observation in an attempt to build an interdisciplinary consensus on the nature and application of mental practice. Mental practice is perceived as a promising motor rehabilitation technique, but critically, there is a lack of clarity or consensus on what mental practice treatment should entail. It is also not clear what are the most appropriate outcomes to measure imagery ability and cognitive or behavioural change following mental practice. A further important issue that needs consideration as part of this research topic is dosage, as it is currently unclear how much mental practice is appropriate and whether this depends on patient variables such as age, cognitive functioning, motor function, or pathophysiology.

System Jonathan A. Hyam,Erlick A. C. Pereira,Alexander L. Green,2016-04-14 Autonomic surgery is an important and expanding field within contemporary clinical practice Surgical therapies influencing the autonomic nervous system have historically entailed disabling various components of its network by injurious methods More sophisticated techniques have now emerged to allow modulation of neural function by electrical implants or by preservative surgery This has fuelled the expansion in this field as safer therapies with greater scope for patient benefit have become available As the potential for precise neural manipulation has advanced so has the number and diversity of diseases which have become amenable to such therapies This book reviews the basic science underpinning the autonomic control of various body systems and the state of

the art clinical applications by which these systems are surgically modulated in patients today Clinical chapters include details of the procedure operative considerations outcomes adverse effect profile post operative management of such patients and reflections on personal experience Autonomic surgery can be applied to a wide variety of diseases affecting large numbers of the population such as angina pectoris hypertension orthostatic hypotension sexual dysfunction regional pain syndromes headache and epilepsy Laboratory Manual for Zoology Tracy Irwin Storer,Robert Leslie Usinger,1958
