Polygons, Polyominoes and

Polycubes A. J. Guttmann, 2009-03-30 The problem of counting the number of self avoiding polygons on a square grid thereby their perimeter or their enclosed area is a problem that is so easy to state that at first sight it seems surprising that it hasn't been solved It is however perhaps the simplest member of a large class of such problems that have resisted all attempts at their exact solution These are all problems that are easy to state and look as if they should be solvable They include percolation in its various forms the Ising model of ferromagnetism polyomino enumeration Potts models and many others These models are of intrinsic interest to mathematicians and mathematical physicists but can also be applied to many other areas including economics the social sciences the biological sciences and even to traffic models It is the widespread applicability of these models to interesting phenomena that makes them so deserving of our attention Here however we restrict our attention to the mathematical aspects Here we are concerned with collecting together most of what is known about polygons

and the closely related problems of polyominoes We describe what is known taking care to distinguish between what has been proved and what is certainly true but has not been proved The earlier chapters focus on what is known and on why the problems have not been solved culminating in a proof of unsolvability in a certain sense The next chapters describe a range of numerical and theoretical methods and tools for extracting as much information about the problem as possible in some cases permitting exact conjectures to be made
