In the following exercises, you will use the data in the Premiere Products database shown in Figure 2.1 in Chapter 2. If you have access to a DBMS, use the DBMS to perform the tasks and explain the steps you used in the process. If not, explain how you would use SQL to obtain the desired results. Check with your instructor if you are not certain about which approach to take.

1. Create the SmallCust view described in Review Question 2. It consists of the number, name, address, balance, and credit limit for all customers with credit limits that are equal to or less than \$7,500. Display the data in the view.
2. Create the CustOrder view described in Review Question 3. It consists of the customer number, name, balance, order number, and order date for every order currently on file. Display the data in the view.
3. Create a view named OrdTot. It consists of the order number and order total for each order currently on file. (The order total is the sum of the number ordered multiplied by the quoted price on each order line for each order.) Display the data in the view.
4. Create the following indexes. If it necessary to name the index in your DBMS, use the indicated name.
 - a. Create an index named PartInd on the PartNum field in the OrderLine table.
 - b. Create an index named PartInd2 on the Class field in the Part table.
 - c. Create an index named PartInd3 on the Class and Warehouse fields in the Part table.
 - d. Create an index named PartInd4 on the Class and OnHand fields in the Part table and list units on hand in descending order.
5. Drop the PartInd3 index.
6. Assume that the Part table has been created, but that there are no integrity constraints. Create the necessary integrity constraint to ensure that the only allowable values for the Class field are AP, HW, and SG. Indicate that the PartNum field is the primary key and that the PartNum field in the OrderLine table is a foreign key that must match the primary key of the Part table.
