Mathematical Techniques Dominic William Jordan,Peter Smith,1997 Undergraduate students of engineering science and mathematics must quickly master a variety of mathematical methods although many of these students do not have strong mathematics backgrounds In this well received book now in its second edition the authors use their extensive experience with diverse groups of students to provide an accessible introduction to mathematical techniques They start at the elementary level and proceed to cover the full range of topics typically encountered by beginning students BL Analytic geometry vector algebra vector fields div and curl differentiation and integration BL Complex numbers matrix operations and linear systems of equations BL Differential equations and first order linear systems functions of more than one variable double integrals and line integrals BL Laplace transforms Fourier series and Fourier transforms BL Probability and statistics Incorporating many suggestions from readers this new edition has expanded discussions of vectors and new chapters on Fourier series and on probability and statistics The emphasis throughout is on understanding concepts through well chosen examples and the book includes over 500 fully worked problems As far as is possible chapter topics are self contained so that a student only needing to master certain techniques can omit others without trouble The generously illustrated text also includes simple numerical processes which lead to examples and projects for computation particularly with Mathematica and contains a large number of exercises with answers to reinforce the material These features combine to make this book an ideal starting point for students entering the sciences

Algebraic Frames for the Perception-Action Cycle Gerald Sommer,Yehoshua Y. Zeevi,2000-09-01 This

volume presents the proceedings of the 2nd International Workshop on Algebraic Frames for the Perception and Action Cycle AFPAC 2000 held in Kiel Germany 10-11 September 2000. The presented topics cover new results in the conceptualization, design and implementation of visual sensor based robotics and autonomous systems. Special emphasis is placed on the role of algebraic modelling in the relevant disciplines such as robotics, computer vision, theory of multidimensional signals and neural computation. The aims of the workshop are twofold: first, discussion of the impact of algebraic embedding of the task at hand on the emergence of new qualities of modelling; and second, facing the strong relations between dominant geometric problems and algebraic modelling. The first workshop in this series AFPAC 97 inspired several groups to initiate new research programs or to intensify ongoing research work in this field and the range of relevant topics was consequently broadened. The approach adopted by this workshop does not necessarily fit the mainstream of worldwide research granting policy. However, its search for fundamental problems in our field may very well lead to new results in the relevant disciplines and contribute to their integration in studies of the perception-action cycle.
