Drummond Earley III, 2020-03-27 Current trends in mining are driving the demand for subsurface extraction technologies with low surface impacts that protect surface and ground water Moreover the necessity for sustainable mineral extraction technologies has increased as regulatory restrictions and technical challenges to traditional mining grow with production from deeper and deeper remaining metal resources This book provides a state of the art synopsis of in situ metal recovery and remediation technologies based on both research and commercial projects In situ recovery uses fluid based metal dissolution and recovery to extract one or more commodities from a largely intact rock mass using similar processes that create ore deposits The fluid is circulated through ore by gravity and or pumps using injection and recovery wells A processing facility is usually established at the surface of the operation to extract the commodity of interest The barren fluid is then recirculated back into the recovery circuit In situ remediation uses similar wellfield technology and chemical processes to stabilize metal contaminants by injecting agents that form stable solids or less toxic species when combined with a contaminant The fluid depleted in the stabilizing agent is then pumped back to the surface and regenerated In situ mining or recovery has been successfully applied to several commodities including uranium sulfur evaporites and copper which have favorable chemical properties and deposit types for in situ recovery *Leaching Kinetics of Valuable Metals*

Stefano Ubaldini, 2021-05-07 Leaching is a primary extractive operation in hydrometallurgical processing by which a metal of interest is transferred from naturally occurring minerals into an aqueous solution In essence it involves the selective dissolution of valuable minerals where the ore concentrate or matte is brought into contact with an active chemical solution known as a leach solution Currently the hydrometallurgical processes have a great number of applications not only in the mining sector in particular for the recovery of precious metals but also in the environmental sector for the recovery of toxic metals from wastes of various types and their reuse as valuable metals after purification Therefore there is an increasing need to develop novel solutions to implement environmentally sustainable practices in the recovery of these valuable and precious metals with particular reference to critical metals those included in materials that are indispensable to modern life and for which an exponential increase in consumption is already a reality or will be in a short term perspective For publication in this Special Issue consideration has been given to articles that contribute to the optimization of the kinetic conditions of innovative hydrometallurgical processes economic and of low environmental impact applied to the recovery of valuable and critical metals
