Ordering Phenomena in Rare-Earth Nickelate

Heterostructures Matthias Hepting,2017-06-28 This thesis presents an experimental study of ordering phenomena in rare earth nickelate based heterostructures by means of inelastic Raman light scattering and elastic resonant x ray scattering RXS Further it demonstrates that the amplitude ratio of magnetic moments at neighboring nickel sites can be accurately determined by RXS in combination with a correlated double cluster model and controlled experimentally through structural pinning of the oxygen positions in the crystal lattice The two key outcomes of the thesis are a demonstrating full control over the charge bond and spin order parameters in specifically designed praseodymium nickelate heterostructures and observation of a novel spin density wave phase in absence of the charge bond order parameter which confirms theoretical predictions of a spin density wave phase driven by spatial confinement of the conduction electrons and b assessing the thickness induced crossover between collinear and non collinear spin structures in neodymium nickelate slabs which is correctly predicted by drawing on density functional theory [Archiv Für Hydrobiologie](#) ,1999 [Southwest Hydrology](#)
