Population Density And Distribution Chapter 14:

Insect Populations In theory and in practice Jack P. Dempster, Ian F.G. McLean, 2012-12-06 Insects are by far the largest group of animals on Earth with over a million described species and they occupy a wide range of ecological niches they may be herbivores predators parasites or decomposers Some are of particular economic importance as pests of agriculture and forestry as vectors of animal and human disease or as species of interest to wildlife conservation Thus an understanding of the processes determining their numbers is of considerable practical value Entomologists have played a leading role in developing a theoretical basis to Population Ecology but we still do not have adequate experimental and observational proof for many of the theoretical ideas that have been proposed As a result the subject has been beset with arguments for more than 50 years This volume attempts to reconcile some of these controversies while also reviewing the current state of our knowledge The editors have drawn together an international list of contributors whose views reflect a range of opinions on how natural populations are stabilised They have succeeded in producing a book that both covers the main alternative views in population theory and contains some of the best recent field studies of insect populations This Royal Entomological Society Symposium volume will be of great interest to all entomologists and ecologists particularly those who wish to know more about Population Dynamics

Townsend, 2020-11-17 A definitive guide to the depth and breadth of the ecological sciences revised and updated The revised and updated fifth edition of Ecology From Individuals to Ecosystems now in full colour offers students and practitioners a review of the ecological sciences The previous editions of this book earned the authors the prestigious Exceptional Life time Achievement Award of the British Ecological Society the aim for the fifth edition is not only to maintain standards but indeed to enhance its coverage of Ecology In the first edition 34 years ago it seemed acceptable for ecologists to hold a comfortable objective not to say aloof position from which the ecological communities around us were simply material for which we sought a scientific understanding Now we must accept the immediacy of the many environmental problems that threaten us and the responsibility of ecologists to play their full part in addressing these problems This fifth edition addresses this challenge with several chapters devoted entirely to applied topics and examples of how ecological principles have been applied to problems facing us highlighted throughout the remaining nineteen chapters Nonetheless the authors remain wedded to the belief that environmental action can only ever be as sound as the ecological principles on which it is based Hence while trying harder than ever to help improve preparedness for addressing the environmental problems of the years ahead the book remains in its essence an exposition of the science of ecology This new edition incorporates the results from more than a thousand recent studies into a fully up to date text Written for students of ecology researchers and practitioners the fifth edition of Ecology From Individuals to Ecosystems is an essential reference to all aspects of ecology and addresses environmental problems of the future **Megalopolis: The Giant City in History** Theo Barker, Anthony Sutcliffe, 1993-12-13 This book follows the evolution of the very large city across the world from its origins in Ancient times to its current dominant position in both the industrialised world and the Third World In depth studies are devoted to the key giant cities of human history at decisive points in their growth The case studies include Rome London Saint Petersburg Moscow Bangkok and Berlin Additional studies deal with the general characteristics of the megalopolis stressing its implications for cultural life

structure of communities over time and space Other works in insect ecology stop there essentially limiting presentation of insect ecology to evolutionary responses of insects to their environment including the activities of other species The unique aspect of this book is its four chapters on ecosystem structure and function and how herbivores pollinators seed predators and detritivores drive ecosystem dynamics and contribute to ecosystem stability Provides the most advanced synthesis of insect ecology with updated material throughout and new chapters Presents the roles of insects in delivery of ecosystem services and applications to pest management and conservation Features full coverage of ecosystem structure and function balanced with essential background on evolutionary aspects Includes case studies highlighting practical and theoretical applications for topics covered in each chapter
