varying both in time and space makes extremely high demands on the adaptational capacity and thus flexibility of the carriers of such an ecosystem Longevity combined with immobility during the vegetative phase however appears to contradict the obvious necessity of adaptational flexibility in forest tree populations when compared with short lived and or A baseline studies programme for sustainable and resilient seaweed cultivation in Faroese fjords Wegeberg, Susse, Mols-Mortensen, Agnes, Hancke, Kasper, á Norði, Gunnvør, Available online https pub norden org temanord2023 551 The overall aim of this report is to provide an overview of the most relevant environmental effects and potential impacts on the marine environment related to seaweed cultivation in the Faroe Islands The identified environmental impacts were evaluated for their relevance and significance for cultivation in the Faroe Islands The report includes a number of potential effects and impacts that have been identified and addressed according to their expected significance From this scoping of potential environmental impacts from seaweed cultivation in the Faroe Islands a baseline programme is suggested Such a baseline programme and a consecutive monitoring program is needed to safeguard a future sustainable and resilient macroalgal cultivation in Faroese fjords The suggested baseline programme is a first step in this direction Genetics of Forest Trees W.T.
