Proceedings of the Forty-Fifth Annual Ohio Transportation Engineering Conference ,1993-07 *Improved Work Zone Design Guidelines and Enhanced Model of Travel Delays in Work Zones* Helmut T. Zwahlen,2006 The project focuses on two major issues the improvement of current work zone design practices and an analysis of vehicle interarrival time IAT and speed distributions for the development of a digital computer simulation model for queues and travel delays in work zones Important considerations in the development of work zone design guidelines include guidance delineation and the safety of workers and drivers A nationwide survey of current work zone best practices was conducted Based on the review of the existing ODOT guidelines superior practices available in other states relevant research and professional judgment of personnel involved in work zone activities a set of guidelines for work zone design are proposed It is anticipated that these research findings will result in the better design of work zones which will minimize traffic delays and improve safety In the second part of the project trailers each using two Wavetronix microwave radar units in side fire mode were developed to nonintrusively measure traffic The traffic was measured at six work zones sites with different types of lane configurations at different freeways in Ohio Traffic on the road was also independently measured using video and radar and the results compared to records from the trailers to verify that the trailers were measuring the traffic with reasonable accuracy IAT data of successive vehicles in freeflowing traffic ahead of work zones were analyzed and IAT distributions were generated as a function of the traffic volume for each lane and relationships between traffic volumes and cumulative IAT distributions were established allowing a direct conversion from hourly traffic counts to corresponding cumulative IAT distributions This conversion method produces fairly accurate cumulative IAT distributions for selected hourly traffic volumes It was also found that the same cumulative IAT distribution can be used to model the free flowing traffic at other freeway locations in Ohio which means that the IAT distributions are portable and scalable and a microscopic digital computer simulation model based on queueing theory may be developed to investigate traffic delays in work zones Volume Reduction of Highway Runoff in Urban Areas Eric Strecker,Aaron Poresky,Robert M. Training Manual, 2001 *Vegetated Biofilter for Post Construction Storm Water Management for Linear Transportation Projects* Gayle F. Mitchell, 2010 The vegetated biofilter is a low impact development technique that can be integrated into stormwater management of linear transportation systems and capitalize on the natural environment to mitigate stormwater

A 4 ft 1 2 m wide by 14 ft 4 3 m long prototype vegetated biofilter was constructed on a moveable frame Artificial runoff was delivered to each of three grass beds for comprehensive tests at slopes and flow rates as follows 8 1 medium 4 1 medium 2 1 medium and 2 1 high The medium and high flows represented storm runoff events typical in Ohio First baseline tests were performed to obtain concentrations of constituents native to the biofilter Artificial runoff formulated with metals native soil and motor oil was applied to one bed at a high concentration for the first part of the event followed by a medium concentration a second bed received medium followed by low concentration runoff and the third bed received low concentration followed by tap water During the simulated storm events samples were obtained from the inlet surface runoff and underdrain and analyzed for total and dissolved metals TSS and oil and grease Prior to and at the end of testing cores were extracted from the bed separated into soil roots and grass and each component analyzed for metal content per mass of material The two beds receiving the initial high and medium concentration flow performed well and removal of 7 total metals and TSS was above 75% Removal of oil ranged from 30% to over 90% The bed receiving low concentration runoff which was near the baseline levels for constituents had mixed performance of removals ranging from none to above 90% illustrating the difficulty of any BMP to treat a relatively clean influent Metals above background levels were found primarily in the first half 7 ft 2 1 m of each bed Soil particles in the influent flow of the first test in each bed tagged with La were not resuspended in subsequent tests and were not measured at any significant concentration in the outlet surface flow
