### **Control Grid Motion Estimation for Efficient Application of Optical Flow** Christine M. Zwart,David

Frakes,2022-05-31 Motion estimation is a long standing cornerstone of image and video processing Most notably motion estimation serves as the foundation for many of today s ubiquitous video coding standards including H 264 Motion estimators also play key roles in countless other applications that serve the consumer industrial biomedical and military sectors Of the many available motion estimation techniques optical flow is widely regarded as most flexible The flexibility offered by optical flow is particularly useful for complex registration and interpolation problems but comes at a considerable computational expense As the volume and dimensionality of data that motion estimators are applied to continue to grow that expense becomes more and more costly Control grid motion estimators based on optical flow can accomplish motion estimation with flexibility similar to pure optical flow but at a fraction of the computational expense Control grid methods also offer the added benefit of representing motion far more compactly than pure optical flow This booklet explores control grid motion estimation and provides implementations of the approach that apply to data of multiple dimensionalities Important current applications of control grid methods including registration and interpolation are also developed Table of Contents

Rösel,2013-05-23 The Arctic sea ice is characterized by profound changes caused by surface melting processes and the formation of melt ponds in summer Melt ponds contribute to the ice albedo feedback as they reduce the surface albedo of sea ice and hence accelerate the decay of Arctic sea ice To quantify the melting of the entire Arctic sea ice satellite based observations are necessary Due to different spectral properties of snow ice and water theoretically multi spectral optical sensors are necessary for the analysis of these distinct surface types This study demonstrates the potential of optical sensors to detect melt ponds on Arctic sea ice For the first time an Arctic wide multi annual melt pond data set for the years 2000 2011 has been created and analyzed      Computer Vision -- ACCV 2012 Kyoung Mu Lee,Yasuyuki Matsushita,James M.

The Atmosphere over Mountainous Regions Miguel A. C. Teixeira, Daniel J. Kirshbaum, Haraldur Ólafsson,, Peter F. Sheridan, Ivana Stiperski, 2016-11-09 Mountainous regions occupy a significant fraction of the Earth's continents and are characterized by specific meteorological phenomena operating on a wide range of scales Being a home to large human populations the impact of mountains on weather and hydrology has significant practical consequences Mountains modulate the climate and create micro climates induce different types of thermally and dynamically driven circulations generate atmospheric waves of various scales known as mountain waves and affect the boundary layer characteristics and the dispersion of pollutants At the local scale strong downslope winds linked with mountain waves such as the Foehn and Bora can cause severe damage Mountain wave breaking in the high atmosphere is a source of Clear Air Turbulence and lee wave rotors are a major near surface aviation hazard Mountains also act to block strongly stratified air layers leading to the formation of valley cold air pools with implications for road safety pollution crop damage etc and gap flows Presently neither the fine scale structure of orographic precipitation nor the initiation of deep convection by mountainous terrain can be resolved adequately by regional to global scale models requiring appropriate downscaling or parameterization Additionally the shortest mountain waves need to be parameterized in global weather and climate prediction models because they exert a drag on the atmosphere This drag not only decelerates the global atmospheric circulation but also affects temperatures in the polar stratosphere which control ozone depletion It is likely that both mountain wave drag and orographic precipitation lead to non trivial feedbacks in climate change scenarios Measurement campaigns such as MAP T REX Materhorn COLPEX and i Box provided a wealth of mountain meteorology field data which is only starting to be explored Recent advances in computing power allow numerical simulations of unprecedented resolution e g LES modelling of rotors mountain wave turbulence and boundary layers in mountainous regions This will lead to important advances in understanding these phenomena as well as mixing and pollutant dispersion over complex terrain or the onset and breakdown of cold air pools On the other hand recent analyses of global circulation biases point towards missing drag especially in the southern hemisphere which may be due to processes currently neglected in parameterizations A better understanding of flow over orography is also crucial for a better management of wind power and a more effective use of data assimilation over complex terrain This Research Topic includes contributions that aim to shed light on a number of these issues using theory numerical modelling field measurements and laboratory experiments

Ramos, David Barriopedro, Emanuel Dutra, 2015-09-11 Classifications of circulation weather systems have a long history in meteorology and climatology. Starting with manual classifications over specific regions of the globe, these tools, generally called catalogs of synoptic types, were restricted mainly to weather forecasting and historical climate variability studies. In the last decades, the advance of computing resources and the availability of datasets have fostered the development of fast and objective methods that process large amounts of data. In recent years, numerous methods of circulation type classification have been designed, showing their usefulness on a wide range of applications in scientific domains related to weather, climate and environment. This Research Topic highlights methodological advances in circulation weather types and also their applications to different research areas. The articles included in this research topic show that circulation weather types can be used not only in Europe, where they have been always more frequent, but also applied to other regions of the world. *Analog Electronics for Radiation Detection* Renato

Turchetta, 2017-12-19 Analog Electronics for Radiation Detection showcases the latest advances in readout electronics for particle or radiation detectors. Featuring chapters written by international experts in their respective fields, this authoritative text defines the main design parameters of front-end circuitry developed in microelectronics technologies. It explains the basis for the use of complementary metal oxide semiconductor (CMOS) image sensors for the detection of charged particles and other non-consumer applications. It delivers an in-depth review of analog-to-digital converters (ADCs), evaluating the pros and cons of ADCs integrated at the pixel column and per-chip levels. It describes incremental sigma-delta ADCs, time-to-digital converter (TDC) architectures, and digital pulse processing techniques complementary to analog processing. It examines the fundamental parameters and front-end types associated with silicon photomultipliers used for single visible light photon detection. It discusses pixel sensors with per-pixel TDCs, channel density challenges, and emerging 3D technologies interconnecting detectors and electronics. Thus, Analog Electronics for Radiation Detection provides a single source for state-of-the-art information on analog electronics for the readout of radiation detectors.
