

PHOTOLYSE STEMS AND LEAVES

Plants have structures that allow them to absorb light energy and convert it into chemical energy (glucose).

Light energy from the sun is used to make glucose.

There are two main types of photosynthesis:

- C₃ pathway (most common)
- C₄ pathway (less common)
- CAM pathway (very rare)

Photosynthesis occurs in the chloroplasts of plant cells.

Chloroplasts are organelles found in plant cells. They contain green pigments called chlorophylls.

Chlorophylls absorb light energy and convert it into chemical energy (glucose).

Glucose is used for energy.

Glucose is used for energy in two ways: it can be used immediately for energy, or it can be stored in the form of starch. Starch is a polysaccharide made of glucose units. It is stored in the roots and stems of plants. When the plant needs energy, the starch is broken down into glucose and used for energy.
