

WSCS05 Introduction to Wine Business

Transporting Wine over Long Distances

Freighting wine is an unavoidable measure involved in the process of getting a wine from a producer to a consumer (Smith, 2009). It is a risky period where spoilage is likely to occur and can be very costly (Smith, 2009). There are options when it comes to freighting overseas; however using trucks is unavoidable (Perrotti-Brown, 2009). Measures have been taken to help preserve the integrity of the wine during transit, most are of option to the client and with more favourable transport methods comes higher price margins (Smith, 2009).

Main obstacles to be overcome when considering transport of wine over long distances include; cost, spoilage and time (Perrotti-Brown, 2009). Spoilage can be overcome with climate control, which can be costly alike time constraints (Perrotti-Brown, 2009). There are three main types of transport for wines over long distances are by means of land freight, sea freight and air freight. Air freight is the fastest means of transporting wine, however can incur up to ten times the cost of sea freight (Perrotti-Brown, 2009). By all means freighting wine by truck is unavoidable; this is the only method with which wine can be moved from the cellar to plane or ship for international transfers, and from a cellar to retailer or storage facility within the same country (Perrotti-Brown, 2009).

It is important measures are taken so that the quality of wine is preserved during transit. It has been found that ninety percent of quality faults in wine were caused by exposure to heat, of this percentage most of this excessive heat was emitted to the wine during transit rather than by fault of storage at a retail outlet (Smith, 2009). According to the Australian Wine Research Institute wine exposed to temperatures in excess of 40°C will express visual and sensory changes within a few days of exposure (Smith, 2009). Any storage facility where wine is exposed to temperatures of 25°C for long periods of time of 40°C for short periods will compromise the quality of the wine (Smith, 2009).

These temperature restrictions to avoid spoilage have been overcome by land freight companies offering trucks with insulated and climate controlled tanks (Pregler, 2008). However, if the ambient air temperature is suitable, this is unnecessary and will assist with the reduction of cost (Perrotti-Brown, 2009).

Spoilage by contamination is of major concern to the winemaker and has been overcome by trucking companies by using tanks made of food-grade finish stainless steel (Pregler, 2008). This means all welding is smoothed down so that it may not harbour any microbiological life, and the use of aluminium has been disregarded as the porous material can house microbiological organisms (Pregler, 2008).

Between transporting different wines it was once acceptable to use hose water and trisodium phosphate to rinse out the inside of a tank before taking on another wine for transport (Pregler, 2008). Producer and customer standards have become tougher and expect a sanitary vessel before their product enters it (Pregler, 2008). One standard wash is known as the 'Kosher' wash and involves a minimum of 180 degree Celsius temperatures for fifteen minutes. Freighting companies are responsible for this wash and should have tils to carry them out (Pregler, 2008). On-loading and off-loading the wine is the responsibility of the winery or cellar and receiver of the wine, this includes the sanitation of the instruments involved (Pregler, 2008).
