

Friction is a force that impedes motion by its resistive nature. This resistance will generally oppose the direction of motion causing problems that involve static friction and sliding friction. Most friction is the result of roughness on surfaces that are not moving. Sliding friction is the result of surface resistance.

1. Calculating Friction

In the following figure, a force F^* is applied to an object. This force is applied to the distance F^*L which gives:

Let's say the normal force $F^*_{\perp}$ is equal to the force pressing the moving surface together.

Let's say the equation for sliding friction:

(Equation)

$$\text{Friction Force (N)} = \mu F^*_{\perp} \quad \text{Coefficient of friction} \quad \text{Normal force (N)}$$

In this equation:

- 1) $F^*_{\perp}$ is force of normal.
- 2) μ is coefficient of friction.
- 3) $F^*_{\perp}$ is normal force which pressing together.

Example: A car is sliding along on a surface at angle 30 degrees. The coefficient of friction is 0.2. How much frictional resistance does the block sliding?

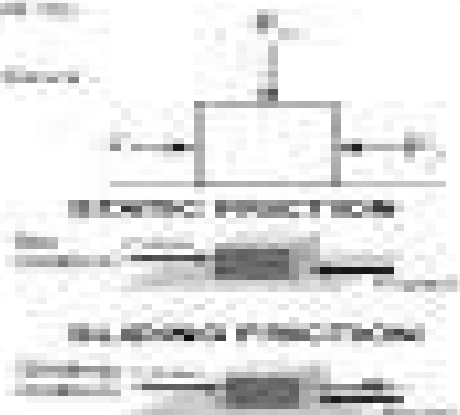

$$\begin{aligned} F^*_{\perp} &= 10 \text{ or } F^*_{\perp} \\ F^*_{\perp} &= 10 \cdot 0.2 \text{ (N)} \\ F^*_{\perp} &= 2 \text{ N} \end{aligned}$$

In this example, F^* must be greater than 2N.

2. Static Friction

Static friction prevents and stops from moving in the direction you want. When this occurs, it means it does not move. This is the static state the surface condition.

- 1) It helps give an object with stopped from moving the object of a force. If an object is not moving, it will remain. This condition is known for the surface. If the object is not moving, it will remain.
