

## Parachute Investigation Design Practical Report

### Background Knowledge :

A parachute is a device that slows the vertical movement of an individual or an object that is falling through the air at great distances. The body surface area is increased by the parachute which increases the air resistance which slows the body that is in motion. An example of parachute being used is when a person or object is dropped from an airplane, potentially who are sky diving and a spacecraft which is re-entering the earth's atmosphere. There are not only vertical configurations, there are also horizontal ones which slow down the object such as race cars that have finished their race who were driving at a great speeds. Parachutes were also used in war times when supplies and equipment was needed in war bases. Parachutes come in two different types of forms, one is dome canopy and the other is rectangular parafoil (see figure 1&2.) The dome canopy is made from fabric in a shape of a hemispherical and cones. (see figure 1.) This type of parachute traps inside its fabric which creates an area full of high pressure that forces movement in the opposite direction of the entrance of air flow. On the other hand, the rectangular parafoil (see figure 2.) has a tubular cells most used by sport jumpers. The parafoil acts like wings which allows the jumper to kind of in a way to fly towards the target of their choice. Each parachute weighs less than 7 kg.

Anything that falls, falls at a constant speed when the magnitude of the upwards acts like a drag force which is caused by air resistance. This equals the magnitude of the downward acting force of gravity. Parachutes are designed to minimise the effect of speed impact. To make the force of impact minimised the speed before the impact must be minimised. The formulae which shows the parachutes falling at a constant speed is shown by:

$$V_{\text{impact}} = \frac{s}{t} \quad \text{SO} \quad V_{\text{impact}} \propto \frac{1}{\text{drop time}} \quad \text{(with "s" constant)}$$

The relationship between  $V_{\text{impact}}$  and drop time is proportional inversely, minimising  $V_{\text{impact}}$  also means maximising the drop time.

**Aim :** The aim of this practical is to find out which parachute which will take the longest time to reach the ground.

### Hypothesis :

It is hypothesised that the larger the surface area of the parachute the greater amount of time it will take to reach the ground.

### Variables :

Independent – the radius of each parachute

Dependant – time taken to reach the ground

Controlled – distance of the parachute being dropped from (2m)
