Particular Solutions of the Wave Equation Maurice Cohen, 1961 *An Introduction to the Mathematical Theory of Waves* Roger Knobel, 2000 This book is based on an undergraduate course taught at the IAS Park City Mathematics Institute Utah on linear and nonlinear waves The first part of the text overviews the concept of a wave describes one dimensional waves using functions of two variables provides an introduction to partial differential equations and discusses computer aided visualization techniques The second part of the book discusses traveling waves leading to a description of solitary waves and soliton solutions of the Klein Gordon and Korteweg deVries equations The wave equation is derived to model the small vibrations of a taut string and solutions are constructed via d'Alembert's formula and Fourier series The last part of the book discusses waves arising from conservation laws After deriving and discussing the scalar conservation law its solution is described using the method of characteristics leading to the formation of shock and rarefaction waves Applications of these concepts are then given for models of traffic flow The intent of this book is to create a text suitable for independent study by undergraduate students in mathematics engineering and science The content of the book is meant to be self contained requiring no special reference material Access to computer software such as Mathematica[®] MATLAB[®] or Maple[®] is recommended but not necessary Scripts for MATLAB applications will be available via the Web Exercises are given within the text to allow further practice with selected topics **The Wave Equation** Open university. partial differential equations of applied mathematics course team, 1973 *Methods of Calculating Fundamental Solutions of the Wave Equation, with Tables*, 1959 **Solutions of the Wave Equation by Use of Operators** Ronald Max Coleman, 1968 *Parabolic Wave Equations with Applications* Michael D. Collins, William L. Siegmann, 2019-11-04 This book introduces parabolic wave equations their key methods of numerical solution and applications in seismology and ocean acoustics The parabolic equation method provides an appealing combination of accuracy and efficiency for many nonseparable wave propagation problems in geophysics While the parabolic equation method was pioneered in the 1940s by Leontovich and Fock who applied it to radio wave propagation in the atmosphere it thrived in the 1970s due to its usefulness in seismology and ocean acoustics The book covers progress made following the parabolic equation's ascendancy in geophysics It begins with the necessary preliminaries on the elliptic wave equation and its analysis from which the parabolic wave equation is derived and introduced Subsequently the authors demonstrate the use of rational approximation techniques the Padé solution in particular to find numerical solutions to the energy conserving parabolic equation three dimensional parabolic equations and horizontal wave equations The rest of the book demonstrates applications to seismology ocean acoustics and beyond with coverage of elastic waves sloping interfaces and boundaries acousto gravity waves and waves in poro elastic media Overall it will be of use to students and researchers in wave propagation ocean acoustics geophysical sciences and more **The Wave Equation: an Overview** Lionel D. Price, Lionel S. Price, 2020-04-25 A quantum gravity theory based on unification of all quantum fields into a single

field is presented The authors aim to assess whether the equations of motion or the conservation equations are more fundamental The application of this resolution to the Transmission Line Matrix modelling method for numerically solving the wave equation is also addressed Flux density is proportional to the density of momentum As such the general procedure is described wherein this concept is applied to other Hermitian operators An alternative metric is presented in this compilation which satisfies Einstein s field equations This metric does not depend on weak field approximation however it replaces Schwarzschild metric under certain conditions and provides an elegant solution for the rotation curves of galaxies An optical wave equation for scattered light in materials with macroscopic spatial inhomogeneities is presented and analysed The equation is applicable to variety of linear and nonlinear optical interactions in media with intrinsic induced or engineered inhomogeneities Lastly the authors explore a black hole solution to the Jackiw Teitelboim field equations for two dimensional gravity It turns out that the wave frequency is also connected to a suitable black hole metric dilaton field and cosmological constant
