Figure 3.5.6 The recursive best-first search algorithm.

Figure 3.5.6 shows one of many. For this reason, RB is not presented for pseudocode. In fact, there are numerous algorithms that implement the same problem without requiring explicitly an implementation of a minimax or maximax node. We discuss these next.

3.5.2 Iterative Deepening Search

The simplest way to reduce memory requirements for RB is to allow the idea of iterative deepening in the heuristic search context, resulting in the **Iterative Deepening RB** (IDRB) algorithm. The main difference between IDB* and iterative heuristic deepening is that the search controls the f -costing, ∞ rather than the depth, as with IDB*. The search stops when the search reaches a node with f -cost less than or equal to the f -cost of the previous iteration. IDB* is presented for heuristic problems with only one node per level. The algorithm is modified accordingly to handle multiple children of nodes. Unfortunately, it differs from the more efficient and more robust IDB* in that the heuristic values of children are search described in Figure 3.5.7. The algorithm is similar to other iterative heuristic algorithms, such as IDB* and IDA*.

Iterative Deepening Search (IDRB) is a simple iterative algorithm that attempts to solve the problem of searching for the search tree using only those given. The algorithm is shown in Figure 3.5.8. Its operation is similar to that of a minimax depth-first search. The algorithm maintains a f -costing, ∞ rather than the depth, as with IDB*. The search stops when the search reaches a node with f -cost less than or equal to the f -cost of the previous iteration. IDB* is presented for heuristic problems with only one node per level. The algorithm is modified accordingly to handle multiple children of nodes. Unfortunately, it differs from the more efficient and more robust IDB* in that the heuristic values of children are search described in Figure 3.5.7. The algorithm is similar to other iterative heuristic algorithms, such as IDB* and IDA*.

Rescuing Econometrics Duo Qin,2023-12-01 Haavelmo s 1944 monograph The Probability Approach in Econometrics is widely acclaimed as the manifesto of econometrics This book challenges Haavelmo s probability approach shows how its use is delivering defective and inefficient results and argues for a paradigm shift in econometrics towards a full embrace of machine learning with its attendant benefits Machine learning has only come into existence over recent decades whereas the universally accepted and current form of econometrics has developed over the past century A comparison between the two is however striking The practical achievements of machine learning significantly outshine those of econometrics confirming the presence of widespread inefficiencies in current econometric research The relative efficiency of machine learning is based on its theoretical foundation and particularly on the notion of Probably Approximately Correct PAC learning Careful examination reveals that PAC learning theory delivers the goals of applied economic modelling research far better than Haavelmo s probability approach Econometrics should therefore renounce its outdated foundation and rebuild itself upon PAC learning theory so as to unleash its pent up research potential The book is catered for applied economists econometricians economists specialising in the history and methodology of economics advanced students philosophers of social sciences **Guide to**
