It is recommended that you first read through the entire assignment (2-4 weeks) up to the point that you feel confident in your understanding of the content. Then study guide (which should be completed around 2-3 weeks) thoroughly. This is the best way to prepare for the exam. The study guide should be finished for understanding of the content and for the exam. The study guide should be finished for understanding of the content and for the exam.

## Answer the following questions:

- 1.1 Describe the hydrologic cycle, components, and processes. The hydrologic cycle is a continuous process that moves water from the atmosphere to the land and back to the atmosphere. It is a cycle of water that moves from the atmosphere to the land and back to the atmosphere. The cycle is driven by the sun's energy, which causes water to evaporate from the surface of the ocean and land. The water vapor then condenses into clouds, which eventually release the water as precipitation. The water then flows back to the ocean or infiltrates the ground, where it can be stored for a long time before returning to the atmosphere.
- 1.2 Define erosion, and the following erosion parts: runoff, channels, meanders, oxbow lakes, and floodplains. Erosion is the process of wearing away the Earth's surface. It is a natural process that occurs all over the world. The process is driven by the sun's energy, which causes water to evaporate from the surface of the ocean and land. The water vapor then condenses into clouds, which eventually release the water as precipitation. The water then flows back to the ocean or infiltrates the ground, where it can be stored for a long time before returning to the atmosphere.
- 1.3 Define drainage basin and divide. A drainage basin is the area of land that drains water into a single body of water. A divide is a ridge or high ground that separates two drainage basins. It is a natural barrier that prevents water from flowing from one basin to another.
- 1.4 Define drainage patterns: dendritic, radial, rectangular, trellis, anastomosing, and parallel. Drainage patterns are the ways in which water flows on the Earth's surface. They are determined by the shape of the land and the direction of the water flow. The most common drainage patterns are dendritic, radial, rectangular, trellis, anastomosing, and parallel.
- 1.5 Describe how erosion, transportation, and deposition are affecting the land and water. Erosion is the process of wearing away the Earth's surface. Transportation is the process of moving the eroded material from one place to another. Deposition is the process of dropping the eroded material in a new location. These three processes are constantly occurring on the Earth's surface, and they are responsible for the changes we see in the landscape over time.
- 1.6 Define alluvial fans, braided rivers, and oxbow lakes. Alluvial fans are landforms that are formed by the deposition of sediment at the base of a mountain range. Braided rivers are rivers that are characterized by multiple channels that shift and change frequently. Oxbow lakes are bodies of water that are formed when a meandering river eventually cuts off a section of its channel, leaving a lake behind.
- 1.7 Describe how the Earth's surface is changing over time. The Earth's surface is constantly changing over time. This is due to a variety of factors, including erosion, transportation, and deposition. These processes are driven by the sun's energy, which causes water to evaporate from the surface of the ocean and land. The water vapor then condenses into clouds, which eventually release the water as precipitation. The water then flows back to the ocean or infiltrates the ground, where it can be stored for a long time before returning to the atmosphere.
- 1.8 Define the different types of sediment and how they are deposited. Sediment is the material that is left behind after erosion and transportation. It is composed of small particles of rock, soil, and organic matter. Sediment is deposited in a variety of ways, including by wind, water, and ice. The different types of sediment are determined by the size of the particles and the way they are deposited.
