Gizmo Warm-up

A **population** is a group of individuals of the same species that live in the same area. The size of a population is determined by many factors. In the *Rabbit Population by Season* Gizmo, you will see how different factors influence how a rabbit population grows and changes.

1. Select the **BAR CHART** tab. What is the size of the initial rabbit population?

40

2. Select the **TABLE** tab. Click **Play** (▶), and allow the simulation to run for one year.

- A. In which season did the rabbit population increase the most?

spring

- B. In which season did the rabbit population increase the least?

Question: What determines how large a population can grow?

1. Think about it: A **limiting factor** is any factor that controls the growth of a population. What do you think are some of the limiting factors for the rabbit population?

winter, food, predators, space, ect

2. Run Gizmo: Select the **DESCRIPTION** tab. Set the **Simulation speed** to **Fast**. Select the **GRAPH** tab. Click **Play**, and allow the simulation to run for at least 10 years. (Note: You can use the zoom controls on the right to see the whole graph.)

Population Dynamics Alternative Models provides a theoretical framework of population dynamics. This book contains seven chapters that discuss the controversies surrounding discussions on the explicit view of the subject. Chapters 1 and 2 present a general introduction to the terminology, the mathematical background, and the philosophical approach that lie behind the theoretical development. Chapter 3 contains a series of models accounting for variations in population growth rates, sizes, and fluctuations, while Chapter 4 examines a model accounting for the evolution of life history patterns. A more detailed examination of the effects of predation on prey populations, especially with respect to determining a prey population's maximum sustainable yield, is explored in Chapter 5. Chapter 6 highlights the interspecific competition theory in terms of the population dynamics models presented in a previous chapter. Chapter 7 summarizes the developments in the population dynamics research studies. This work will be of great value to ecologists, biologists, and population dynamics researchers.

Population Dynamics and the Tribolium Model: Genetics and Demography Robert F. Costantino, Robert A. Desharnais, 2012-12-06

The study of populations is becoming increasingly focused on dynamics. We believe there are two reasons for this trend. The first is the impact of nonlinear dynamics with its exciting ideas and colorful language: bifurcations, domains of attraction, chaos, fractals, strange attractors. Complexity, which is so very much a part of biology, now seems to be also a part of mathematics. A second trend is the accessibility of the new concepts. The barriers to communication between theorists and experimentalists seem less impenetrable. The active participation of the experimentalist means that the theory will obtain substance. Our role is the application of the theory of dynamics to the analysis of biological populations. We began our work early in 1979 by writing an ordinary differential equation for the rate of change in adult numbers, which was based on an equilibrium model proposed a decade earlier. During the next few months, we filled our notebook with straightforward deductions from the model and its associated biological implications. Slowly, some of the biological observations were explained, and papers followed on a variety of topics: genetic and demographic stability, stationary probability distributions for population size, population growth as a birth-death process, natural selection and density-dependent population growth, genetic disequilibrium, and the stationary stochastic dynamics of adult numbers.
