from the trenches advice has been repeatedly tested in real life applications Expanded coverage includes descriptions of overseas manufacturer s products and concepts model based optimization in control theory new major inventions and innovations in control valves and a full chapter devoted to safety With more than 2000 graphs figures and tables this all inclusive encyclopedic volume replaces an entire library with one authoritative reference The fourth edition brings the content of the previous editions completely up to date incorporates the developments of the last decade and broadens the horizons of the work from an American to a global perspective B la G Lipt k speaks on Post Oil Energy Technology on the AT T Tech Channel

Preparation of Polymer Nano-Foams Alexander Müller,2013-11-27 The current energy debate considerably affects science economy and politics A key aspect of this discussion is energy saving by improvement of thermal insulations for buildings In this regard nano insulation materials NIMs are the insulation materials of the future If additionally a pore size reduction to nanoscale results in optical transparency completely new markets for polymer foams will arise However the realization of these high potential materials is accompanied by many challenges as for example the extremely high interfacial tension emerging during foaming processes that cause an undesired coarsening of the foam structure To overcome these challenges new strategies and templates have to be scientifically developed Moreover it is crucial to understand the foaming in detail In this context the early state of foaming was studied by means of the principle of supercritical microemulsion expansion POSME The benefit of using microemulsions containing a super or near critical fluid as oil component is the thermodynamic stability at high pressures This allows a fast repeatability of the expansion process at nanoscale by applying pressure cycles In combination with a specially designed stroboscopic high pressure cell the structural processes could be observed by time resolved small angle neutron scattering experiments It turned out that the addition of a low molecular oil as anti aging agent results in a deceleration of foam coarsening during expansion by more than an order of magnitude Parallel to these studies the nanofoams by continuity inversion of dispersions NF CID principle was utilized for the preparation of nanoporous polymeric materials The significant innovation of the NF CID principle is the generation of an extremely high number density of propellant pools by a continuity inversion of a CO₂ soaked colloidal crystal i e the formerly discrete polymer nanoparticles convert into a homogeneous matrix with nanodisperse fluid inclusions if the temperature is raised above the glass transition of the respective polymer Expanding those templates by applying a specific set of parameters led to polymethylmethacrylate and polystyrene nanoporous materials that feature pore sizes smaller than 100 nm
