**Procedure:**

The risks, benefits, indications and alternatives of the procedure were discussed with the patient and informed consent was signed. The patient was then taken to the procedure room and prepped and draped in the usual sterile fashion.

The labia and clitoris were then marked using the marking pen to the patient's specifications.

The perineal area was infiltrated first with the creation of a small bleb followed by infiltration of the labia majora up to the clitoris on the left side.

The same technique was done on the right side.

The labia minora was then infiltrated along the lines of demarcation. They were then clamped using Heaney clamps and the tissue excised. The clamped tissue was then cauterized using a single tip Bovie. Excellent hemostasis was confirmed.

The clitoral hood was then trimmed using scissors. The exposed tissue of clitoral hood and labia were re-approximated using 3-0 Monoderm. Excellent hemostasis was noted.

This completed the procedure. The patient tolerated the procedure and was discharged home in stable condition.
