

# Quarrel

Let us quarrel for these reasons:  
You detest the salt which seasons  
My speech . . . and all my lights go out  
In the cold poison of your doubt.  
I love Shelley . . . you love Keats  
Something parts and something meets.  
I love salads . . . you love chops;  
Something goes and something stops.  
Something hides its face and cries;

Something shivers; something dies.  
I love blue ribbons brought from fairs;  
You love sitting splitting hairs.  
I love truth, and so do you . . .  
Tell me, is it truly true?

operating system OS then this book is for you     *Jump Start!* David Herzog, 2014 Jumpstart takes a multipronged approach to health and wellness that provides impressive results quickly     **The Frankencamera** Eino-Ville Aleksi Talvala, 2011

Digital cameras both in traditional form factors and as parts of cell phones have become ubiquitous over the last decade. But for the most part they remain black boxes to the end user and cannot be reprogrammed or modified. This has become an obstacle to researchers in the new field of computational photography who want to use the growing computing power of digital cameras to create images no traditional camera could produce. This dissertation presents the Frankencamera platform, a digital camera system designed for computational photography. The Frankencamera is a fully open, fully programmable digital camera which can be easily modified to test out new research ideas. The Frankencamera architecture allows for per frame control of the capture process and accurate synchronization of all the components that make up the camera. Based on this architecture, this dissertation details two hardware platforms: the F2, a flexible custom built camera, and the Nokia N900, a commercial smartphone. Both platforms can be easily programmed at a high level using the FCam API, written to embody the Frankencamera architecture. Finally, this dissertation presents several sample applications for the Frankencamera platform. Several of these applications could not have been developed for any existing camera platform, and the ease and speed at which they were written show that the Frankencamera platform is a compelling tool for computational photography.

The Web is merging with a variety of technologies: cell phones, laptop computers, hand-held organizers, information appliances, and GPS and other sensors. The capability for access anytime and anywhere is here. The increasing frequency of cell phone calls at inappropriate times testifies that people no longer can easily control access. Devices can determine where they are located and can make a range of information available to users as well as make users available to others or their devices. We have proposed a general technique that promises to assist in mediating access. It capitalises on advantages afforded by computation. Hollan, Stometta, 1992 We first described the negotiation technique in the context of problems involved in scheduling meetings and then showed that similar issues, which at first may seem unrelated but in fact have much in common, arise in other contexts. One such activity gaining immediate access is currently of growing importance because of expanding connectivity via wireless technology. Cell phones

and related technologies make it possible to be constantly available for synchronous interaction At times this can be advantageous but the associated costs and benefits result in a complex tradeoff space for designers as well as users
