Efficient Memoization Algorithms for Query Optimization: Top-Down Join Enumeration Through Memoization on the
Basis of Hypergraphs Pit Fender, 2014-12 For a DBMS that provides support for a declarative query language like SQL the
query optimizer is a crucial piece of software The declarative nature of a query allows it to be translated into many
equivalent evaluation plans The process of choosing a suitable plan from all alternatives is known as query optimization The
basis of this choice are a cost model and statistics over the data Essential for the costs of a plan is the execution order of join
operations in its operator tree since the runtime of plans with different join orders can vary by several orders of magnitude
An exhaustive search for an optimal solution over all possible operator trees is computationally infeasible To decrease
complexity the search space must be restricted Therefore a well accepted heuristic is applied All possible bushy join trees are
considered while cross products are excluded from the search There are two efficient approaches to identify the best plan
bottom up and top down join enumeration But only the top down approach allows for branch and bound pruning which can
improve compile time by several orders of magnitude while still preserving optimality Hence this book focuses on the top
down join enumeration In the first part we present two efficient graph partitioning algorithms suitable for top down join
enumeration However as we will see there are two severe limitations The proposed algorithms can handle only 1 simple
binary join predicates and 2 inner joins Therefore the second part adopts one of the proposed partitioning strategies to
overcome those limitations Furthermore we propose a more generic partitioning framework that enables every graph
partitioning algorithm to handle join predicates involving more than two relations and outer joins as well as other non inner
joins As we will see our framework is more efficient than the adopted graph partitioning algorithm The third part of this book
discusses the two branch and bound pruning strategies that can be found in the literature We present seven advancements to
the combined strategy that improve pruning 1 in terms of effectiveness 2 in terms of robustness and 3 most importantly avoid
the worst case behavior otherwise observed Different experiments evaluate the performance improvements of our proposed
methods We use the TPC H TPC DS and SQLite test suite benchmarks to evaluate our joined contributions As we show the
average compile time improvement in those settings is 100% when compared with the state of the art in bottom up join
enumeration Our synthetic workloads show even higher improvement factors *Allegorical, figurative and symbolical* John
