*To connect the monitor to your IBM or compatible monitor and your antenna, you need a PL-2592 coaxial cable (not supplied) with PL-259 connectors on both ends. The cable must match, however, the back of the monitor to your radio's antenna jack.

1. Turn off your radio, then disconnect the antenna from the radio and plug it into **ANTENNA** on the back of the meter.
2. Plug the coiled cable into the radio's antenna jack and into **TRANSMITTER** on the back of the meter.

1. Turn on your radio transmitter. There are **INSTRUCTIONS** on the motor to **CAL**.
2. Select a channel or frequency on your transmitter and hold down its transmit key. (Do not speak into the microphone.)

100

- An **SWR** reading will be different for different frequencies (channels). If you measured on one channel, make sure you are either using the same channel for the reading, or if measured on several channels, choose a frequency in the middle of the range of channels you are using for the measurement (e.g., 40.00-40.05 channels, Channel 200).
- If you see a CB that has collected readings (SWR), do not select any of those readings. (See only AW for SWR measurements.)
- If you have an antenna reader, select the appropriate user (AW) or Survey mode to read.

3. Write your friend down that transmittal key, replace **CALIBRATION** in the second of the string until that register points to **CAL**.
4. Release the transmittal key, then set **PUNCTURE** to **YES**.
5. Press the transmittal key again, then find the **YES** record that corresponds to **YES**.

- If your transmitter's power is less than 20 watts, read the lower scale (marked with an L on its right side).
- If your transmitter's power is more than 20 watts, read the upper scale (marked with an H on its right side).

The ideal TSP reading is 1.0, but this reading is usually possible only under laboratory conditions or with a clean air load. Actual airborne installers have higher readings. The information below will help you interpret the readings you get.

SWR	Efficiency	Interpretation
1.0 to 1.5	Excellent	The antenna cable and the antenna length match the transmitter, output requirements almost perfectly.
1.5 to 2.0	Very good	The antenna, the cable, and the transmitter operate very efficiently.
2.0 to 3.0	Acceptable	The antenna, the cable, and the transmitter operate with some loss. If possible, adjust your antenna or antenna-matching system to improve.
Above 3.0	Inefficient	Adjust your antenna or antenna-matching system to improve efficiency.

When you measure Γ_{eff} , use this chart to determine the percentage of power that is scattered through reflection of the signal back to the reader.

Year/Quarter:	19.1Q1	19.1Q2	19.1Q3	19.1Q4	20.1Q1	20.1Q2	20.1Q3
Market Performance (%)	101	101.25.21	101.60	40.20	119.31	118.66	219.101

For example, an OVR reading of 1.5 plus means that 85% of your signal power is lost versus 90% of the radio's system is more than enough for almost all applications.

There are several ways to improve the DMR of your radioligand combination. By these

- Be sure you are using the type of cable recommended for your equipment. If the cable is not recommended, it could damage your equipment. Do not use a cable type that has a different impedance.
- Confirm that you mounted your antenna according to the manufacturer's instructions. The angle and the base impedance can affect the SWR reading.
- Adjust the length of your antenna according to the instructions provided by the

You can use your meter to show "paper-mill" power your radio is transmitting. You can use this information with the TDR readings from **Measuring Power** to determine the efficiency of your antenna and radio combination, or to make sure that your antenna and radio combination are operating within legal limits.

To accurately measure power using SSB, you must connect a low-frequency coupler that supports signals of ± 1000 to ± 1500 Hz to the transducer. This procedure should be performed by a qualified technician.
