Domain-Specific Modeling Steven Kelly, Juha-Pekka Tolvanen, 2008-02-13 The authors are pioneers Few in our industry have their breadth of knowledge and experience From the Foreword by Dave Thomas Bedarra Labs Domain Specific Modeling DSM is the latest approach to software development promising to greatly increase the speed and ease of software creation Early adopters of DSM have been enjoying productivity increases of 500

1000% in production for over a decade This book introduces DSM and offers examples from various fields to illustrate to experienced developers how DSM can improve software development in their teams Two authorities in the field explain what DSM is why it works and how to successfully create and use a DSM solution to improve productivity and quality Divided into four parts the book covers background and motivation fundamentals in depth examples and creating DSM solutions There is an emphasis throughout the book on practical guidelines for implementing DSM including how to identify the necessary language constructs how to generate full code from models and how to provide tool support for a new DSM language The example cases described in the book are available the book s Website www.dsmbook.com along with an evaluation copy of the MetaEdit tool for Windows Mac OS X and Linux which allows readers to examine and try out the modeling languages and code generators Domain Specific Modeling is an essential reference for lead developers software engineers architects methodologists and technical managers who want to learn how to create a DSM solution and successfully put it into practice

The Frankencamera Eino-Ville Aleksi Talvala, 2011 Digital cameras both in traditional form factors and as parts of cell phones have become ubiquitous over the last decade But for the most part they remain black boxes to the end user and cannot be reprogrammed or modified This has become an obstacle to researchers in the new field of computational photography who want to use the growing computing power of digital cameras to create images no traditional camera could produce This dissertation presents the Frankencamera platform a digital camera system designed for computational photography The Frankencamera is a fully open fully programmable digital camera which can be easily modified to test out new research ideas The Frankencamera architecture allows for per frame control of the capture process and accurate synchronization of all the components that make up the camera Based on this architecture this dissertation details two hardware platforms the F2 a flexible custom built camera and the Nokia N900 a commercial smartphone Both platforms can be easily programmed at a high level using the FCam API written to embody the Frankencamera architecture Finally this dissertation presents several sample applications for the Frankencamera platform Several of these applications could not have been developed for any existing camera platform and the ease and speed at which they were written show that the Frankencamera platform is a compelling tool for computational photography
