Hoffmann,Louis E. Stein,2013-11-11 This book has been conceived to provide guidance on the theory and design of cyclone systems For those new to the topic a cyclone is in its most basic form a stationary mechanical device that utilizes centrifugal force to separate solid or liquid particles from a carrier gas Gas enters near the top via a tangential or vaned inlet which gives rise to an axially descending spiral of gas and a centrifugal force field that causes the incoming particles to concentrate along and spiral down the inner walls of the separator The thus segregated particulate phase is allowed to exit out an underflow pipe while the gas phase constricts and in most separators reverses its axial direction of flow and exits out a separate overflow pipe Cyclones are applied in both heavy and light industrial applications and may be designed as either classifiers or separators Their applications are as plentiful as they are varied Examples include their use in the separation or classification of powder coatings plastic fines sawdust wood chips sand sintered powdered metal plastic and metal pellets rock and mineral concentrates carbon fines grain products pulverized coal chalk coal and coal ash catalyst and petroleum coke fines mist entrained off of various processing units and liquid components from scrubbing and drilling operations They have even been applied to separate foam into its component gas and liquid phases in recent years
