Operations Research OR emerged in an effort to improve the effectiveness of newly inducted weapons and equipment during World War II While rapid growth of OR led to its becoming an important aid to decision making in all sectors including defense its contribution in defense remained largely confined to classified reports Very few books dealing with applications of quantitative decision making techniques in military have been published presumably due to limited availability of relevant information The situation changed rapidly during the last few years The recognition of the subject of Military Operations Research MOR gave tremendous boost to its development Books and journals on MOR started appearing The number of sessions on MOR at national and international conferences also registered an increase The volume of teaching training and research activities in the field of MOR at military schools and non military schools enhanced considerably Military executives and commanders started taking increasing interest in getting scientific answers to questions pertaining to weapon acquisition threat perception and quantification assessment of damage or casualties evaluation of chance of winning a battle force mix deployment and targeting of weapons against enemy targets war games and scenario evaluation Most of these problems were being tackled on the basis of intuition judgment and experience or analysis under very simple assumptions In an increasingly sophisticated and complex defense scenario resulting in advances in equipment and communications the need for supplementing these practices by scientific research in MOR became imperative

Operations Research and Decision Aid Methodologies in Traffic and Transportation Management Martine Labbe, Gilbert Laporte, Katalin Tanczos, Philippe Toint, 2013-06-29 Every one relies on some kind of transportation system nearly every day Go ing to work

shopping dropping children at school and many other cultural or social activities imply leaving home and using some form of transportation which we expect to be efficient and reliable. Of course efficiency and reliability do not occur by chance but require careful and often relatively complex planning by transportation system managers both in the public and private sectors. It has long been recognized that mathematics and more specifically operations research is an important tool of this planning process. However the range of skills required to cover both fields even partially is very large and the opportunities to gather people with this very diverse expertise are too few. The organization of the NATO Advanced Studies Institute on Operations Research and Decision Aid Methodologies in Traffic and Transportation Management in March 1997 in Balatonfured Hungary was therefore more than welcome and the group of people that gathered for a very studious two weeks on the shores of the beautiful lake Balaton did really enjoy the truly multidisciplinary and high scientific level of the meeting. The purpose of the present volume is to report in a chronological order the various questions that were considered by the lecturers and the students at the institute. After a general introduction to the topic the first week focused on issues related to traffic modeling mostly in an urban context.
