

1) Explain the graph we received in the simulation that shows the relationship between the received (throughput) and sent (load) packets. Why does the throughput drop when the load is either very low or very high?

Solution: The figure 1 shows that maximum throughput is achieved at a load around 500 packets/second. Once it's over 500 the network becomes congested and high collision the amount of received packets can decrease once the sent packets keep increasing .

Figure 1 show the network congested and high collision.

2) Use three duplicates of the simulation scenario implemented in this lab named Coax_01, Coax_005, and Coax_0025. Make sure that the Interarrival Time attribute of the *Packer Generation Arguments* for all nodes in the scenarios are as follows:

- Coax_01 scenario: exponential(0.1)
- Coax_005 scenario: exponential(0.05)
- Coax_0025 scenario: exponential(0.025)

Solution: We show a high collision in the network when the smaller number of exponential .That generate more collision along the senders try to send their packets See Figure 2.
