Optec 1000 Vision Tester Sample:

New, Improved, Comprehensive, and Automated Driver's License Test and Vision Screening System Sandy H. Straus, 2005 This one of a kind comprehensive study highlights the importance of automated testing techniques and the significance of vision screening measures other than standard visual acuity testing for assessing all drivers and in particular at risk drivers and older drivers Non automated tests tend to be subjective time consuming costly and heavily reliant on the experience of the examiner Due to the high collision injury and fatality rates of all drivers in the State of Arizona and the disproportionate number of at fault older drivers and collision risks in the States of Arizona and Florida new and automated screening methodologies and vision standards are now needed to promote road safety predict visual impairment and evaluate possible restriction or confiscation of driver s licenses This study demonstrates that environmental factors and manner of collisions increase in collision involvement for drivers between ages 50 to 59 years in both Arizona and Florida Drivers age 80 to 89 years in both states are most likely at fault in collisions compared to all other age cohorts These results are consistent among drivers cited for collision involvement due to visual defects These findings which span an 11 year period from 1991 to 2001 not only apply to Arizona and Florida two states with some of the largest proportions of older individuals in the United States but as a global survey of motor vehicle bureau directors or their representatives in the United States Commonwealth of Puerto Rico United Kingdom Canada New Zealand and Australia illustrate any state country province territory commonwealth or nation with an increasing number of older drivers A pilot study to follow ultimately allows for the implementation of effective strategies for screening of visual impairment and eye disease in all Arizona drivers Snellen acuity the most widely used vision testing measure accounts for less than 0.1 % of the visual field and fails to quantify contrast sensitivity and color vision Fink and Sadun 2004 two of several visual parameters needed for safe driving It is recommended that at risk and older drivers in Arizona be tested for vision through a newly designed system of measures provided by two automated tests to test vision condition and function and one driving simulator to assess eye status Hence it is integrated into a larger system and additional recommendations are provided as these relate to motor vehicle operation skills and cognition These automated systems and methodologies may ultimately serve as a prototype of transportation license testing improvements for all other states countries and agencies e.g. aviation rail maritime commercial vehicles etc to follow Such techniques may also reduce the incidence of fraudulent schemes and issuances of driver s licenses commercial driver s licenses and hazardous materials transportation licenses

Evaluation of the Stereo Optical OPTEC 5000 for Aeromedical Color Vision Screening Nelda J. Milburn, Carrie A. Roberts, Deborah L. Perry, United States. Office of Aerospace Medicine, United States. Federal Aviation Administration, 2013 Screening tests are valued for their ability to detect the presence test sensitivity and the absence test specificity of a disease or a specific condition such as color vision deficiencies CVDs From an aviation safety standpoint it is important to identify those with CVDs because of their potential for accidents if they misinterpret vital color coded information whereas failing an airman with normal color vision has other consequences to the Federal Aviation Administration FAA such as the expense of secondary screening If a screening test has low specificity it can have a high false positive rate meaning that individuals are falsely noted as having the condition being screened So from the airman's standpoint especially if the airman has normal color vision NCV specificity is very important The FAA has a color vision standard for airmen and air traffic controllers because of the occupations high reliance on color coded information Stereo Optical Company Inc requested a review of their model 5000 multifunction screener for aeromedical use and the FAA found that instrument failed 50% of those with NCV The manufacturer made some modifications and requested a re evaluation The validity of the original and modified versions of the OPTEC 5000 called V1 and V2 respectively in this paper was examined in two experiments Experiment 1 involved 29 NCV and 31 CVD subjects that were administered the OPTEC 2000 and the V1 Experiment 2 examined the validity of the original and modified instruments by comparing test outcome on both versions to a diagnostic test using 50 NCV and 51 CVD

subjects In Experiment 1 the V1 failed 41 3% of the NCV participants In Experiment 2 V1 failed 28% and V2 failed 32% of the NCV subjects V1 passed 16% of the subjects diagnosed with CVDs and V2 erroneously passed 12% It is possible that the light emitting diode strip used in the OPTEC 5000 altered the color perception of the pseudo isochromatic test plates and that substituting that light source for one with better color rendering could restore the test s sensitivity and specificity rates The specificity of the OPTEC 5000 in its original and modified states are unacceptably low and neither should be used for aeromedical color vision screening because of their low agreement with a diagnostic test K 101 564 and 563 respectively Abstract Technical report documentation page *Manual of Instructions: Armed Services Vision Tester* Armed Forces-National Research Council Vision Committee,1951
