

Earth

by Cynthia Sherwood

Earth is the "just right" planet. It's not too close to the sun and it's not too far away. That means Earth doesn't get too hot or too cold, unlike all the other planets. Because of its comfortable temperatures, Earth is the only place in the entire universe where we know that life exists. That makes Earth very special!

Earth is unique in another way too. Living creatures must have water to survive. Since water covers about seventy percent of Earth's surface, our planet is an ideal place to support life in many different forms. The rest of Earth's surface is made up of seven land masses called continents.

Scientists say Earth is about four-and-a-half billion years old. Fossils show microscopic life first appeared about a billion years later. Evidence of the first human beings came much later—only about 200-hundred-thousand years ago. That's many millions of years after the dinosaurs became extinct.

Earth is the fifth largest planet and the third planet from the sun, which is about 93 million miles away. It takes one year for Earth to travel completely around the sun. Earth also spins around like a top, going about a thousand miles an hour. You'd think we'd all need seat belts! Earth rotates around like this once every twenty-four hours, and that's what gives us night and day.

Earth is divided into several layers: the top part is called the crust, the part below that is called the mantle, and the part in the center is called the core. The core is solid and is probably made up of iron. Temperatures at the center of the core may be even hotter than the surface of the sun!

Scientists who study Earth are called geologists. Astronauts can also study Earth from space, adding to what we know about our unique and beautiful blue and green planet. Don't you feel lucky to live on the "just right" planet?

Planet By Cynthia Sherwood Earth:

Experimenting on a Small Planet William W. Hay, 2021-09-27 This book is a thorough introduction to climate science and global change. The author is a geologist who has spent much of his life investigating the climate of Earth from a time when it was warm and dinosaurs roamed the land to today's changing climate. Bill Hay takes you on a journey to understand how the climate system works. He explores how humans are unintentionally conducting a grand uncontrolled experiment which is leading to unanticipated changes. We follow the twisting path of seemingly unrelated discoveries in physics, chemistry, biology, geology, and even mathematics to learn how they led to our present knowledge of how our planet works. He explains why the weather is becoming increasingly chaotic as our planet warms at a rate far faster than at any time in its geologic past. He speculates on possible future outcomes and suggests that nature itself may make some unexpected course corrections. Although the book is written for the layman with little knowledge of science or mathematics, it includes information from many diverse fields to provide even those actively working in the field of climatology with a broader view of this developing drama. *Experimenting on a Small Planet* is a must read for anyone having more than a casual interest in global warming and climate change, one of the most important and challenging issues of our time. This new edition includes actual data from climate science into 2021. Numerous Powerpoint slides can be downloaded to allow lecturers and teachers to more effectively use the book as a basis for climate change education.

Becoming Earth Ferris Jabr, 2025-04-01 A vivid account of a major shift in how we understand Earth from an exceptionally talented new voice. Earth is not simply an inanimate planet on which life evolved, but rather a planet that came to life. Glorious, full of achingly beautiful passages, mind-bending conceptual twists, and wonderful characters, Jabr reveals how Earth has been profoundly miraculously shaped by life. Ed Yong, Pulitzer Prize winner and bestselling author of *An Immense World*. FINALIST FOR THE LOS ANGELES TIMES BOOK PRIZE, FINALIST FOR THE OREGON BOOK AWARD, AN AMERICAN LIBRARY ASSOCIATION NOTABLE BOOK OF THE YEAR, A BEST BOOK OF THE YEAR, Smithsonian, Chicago Public Library Booklist, Scientific American, Nature, A BEST BOOK OF THE SUMMER. The Atlantic and NPR's Science Friday. One of humanity's oldest beliefs is that our world is alive. Though once ridiculed by some scientists, the idea of Earth as a vast interconnected living system has gained acceptance in recent decades. We and all living things are more than inhabitants of Earth; we are Earth, an outgrowth of its structure and an engine of its evolution. Life and its environment have coevolved for billions of years, transforming a lump of orbiting rock into a cosmic oasis, a planet that breathes, metabolizes, and regulates its climate. Acclaimed science writer Ferris Jabr reveals a radical new vision of Earth where lush forests spew water, pollen, and bacteria to summon rain; giant animals engineer the very landscapes they roam; microbes chew rock to shape continents; and microscopic plankton, some as glittering as carved jewels, remake the air and sea. Humans are one of the most extreme examples of life transforming Earth. Through fossil fuel consumption, agriculture, and pollution, we have altered more layers of the planet in less time than any other species, pushing

Earth into a crisis But we are also uniquely able to understand and protect the planet's wondrous ecology and self-stabilizing processes Jabr introduces us to a diverse cast of fascinating people who have devoted themselves to this vital work *Becoming Earth* is an exhilarating journey through the hidden workings of our planetary symphony its players its instruments and the music of life that emerges and an invitation to reexamine our place in it How well we play our part will determine what kind of Earth our descendants inherit for millennia to come **Postmodern Politics for a Planet in Crisis** David Ray

Griffin, Richard A.
