Biotechnology is the manipulation of biological organisms to make products that benefit human beings. Biotechnology contributes to such diverse areas as food production, waste disposal, mining and medicine. Plant biotechnology may be defined as the art, science and application of knowledge obtained from the study of life sciences to create technological improvements and change the genetics of plants in order to produce desired characteristics in plant species. This can be accomplished through many different techniques ranging from simply selecting plants with desirable characteristics for propagation to more complex molecular techniques. Genetic engineering deals with synthesis of artificial gene, repair of gene, combining of DNA from two organisms and manipulating the artificial gene together with the recombinant DNA for the improvement of microbes in plants as well as other living beings. Genetic engineering opens a totally new dimension for bioprospecting. The search for new genes and their application is the primary objective of the biotech industry. Gene technology now enables humans to integrate revolutionary new properties into cultivated plants through inter-specific or inter-generic gene transfer which was not possible through classical approach of crop improvement. This book covers all important aspects of practical utility in field of genetic manipulation by different areas of Plant Biotechnology Techniques.
