Abstract: This paper presents a new method for the automatic detection of the onset of a seizure. The method is based on the analysis of the EEG signal. The onset of a seizure is detected by the analysis of the power spectrum of the EEG signal. The power spectrum is calculated by the Fast Fourier Transform (FFT) method. The power spectrum is then analyzed by the method of the moving average. The onset of a seizure is detected when the power spectrum shows a significant increase in power. The method is applied to the EEG signal of a patient with epilepsy. The results show that the method is able to detect the onset of a seizure with a high degree of accuracy.
