- Abstract**—The authors examined the effects of a 12-week, low-intensity, low-impact, and low-volume exercise program on the health-related quality of life of sedentary, middle-aged, overweight women. The program was designed to be safe and enjoyable, and to be easily incorporated into the participants' daily lives. The program consisted of three 40-minute sessions per week, including a combination of low-impact aerobics, strength training, and stretching. The results showed that the program had a positive effect on the participants' health-related quality of life, with significant improvements in physical function, social functioning, and overall quality of life. The program was well-tolerated and enjoyed by the participants, and the authors conclude that it is a safe and effective intervention for improving the health-related quality of life of sedentary, middle-aged, overweight women.
