on December 8 2003 in Mumbai India was the first of a series of scientific meetings devoted to such a perspective Just as the current Web is inherently heterogeneous in data formats and data semantics the Semantic Web will be inherently heterogeneous in its reasoning forms Indeed any single form of reasoning turns out to be unrealistic in the Semantic Web For example ontology reasoning in general relies on monotonic negation for the metadata often can be fully specified while databases Web databases and Web based information systems call for non monotonic reasoning for one would not specify non existing trains in a railway timetable constraint reasoning is needed when dealing with time for time intervals have to be dealt with while forward and/or backward chaining is the reasoning of choice when coping with database like views for views i.e. virtual data can be derived from actual data using operations such as join and projections

coverage While there are several excellent books on constraint programming such books necessarily focus on the main notions and techniques and cannot cover also extensions applications and languages The handbook gives a reasonably complete coverage of all these lines of work based on constraint programming so that a reader can have a rather precise idea of the whole field and its potential Of course each line of work is dealt with in a survey like style where some details may be neglected in favor of coverage However the extensive bibliography of each chapter will help the interested readers to find suitable sources for the missing details Each chapter of the handbook is intended to be a self contained survey of a topic and is written by one or more authors who are leading researchers in the area The intended audience of the handbook is researchers graduate students higher year undergraduates and practitioners who wish to learn about the state of the art in constraint programming No prior knowledge about the field is necessary to be able to read the chapters and gather useful knowledge Researchers from other fields should find in this handbook an effective way to learn about constraint programming and to possibly use some of the constraint programming concepts and techniques in their work thus providing a means for a fruitful cross fertilization among different research areas The handbook is organized in two parts The first part covers the basic foundations of constraint programming including the history the notion of constraint propagation basic search methods global constraints tractability and computational complexity and important issues in modeling a problem as a constraint problem The second part covers constraint languages and solver several useful extensions to the basic framework such as interval constraints structured domains and distributed CSPs and successful application areas for constraint programming Covers the whole field of constraint programming Survey style chapters Five chapters on applications
