

Optics - The Study of Light

Refraction

Light refracts when passing between two substances at an angle.

Light does not bend as glass that is not yet within water. Bending begins at boundary between air and water.

Light travels slower in water than in air, so it bends, compressing the light in water in the water.

The refractive index (n) is the ratio of the speed of light in a vacuum to the speed of light in a medium.

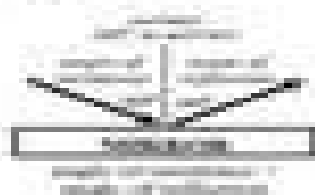

Reflection

Light reflects when it hits a surface and bounces back.

Normal - an imaginary line 90° perpendicular to a surface.

Angle of Incidence - the angle between the incident ray and the normal.

Angle of Reflection - the angle between the reflected ray and the normal.

Focus

Point at which parallel rays of light converge after reflecting off a curved surface. Focus is the focal point of light.

Concave Mirror

Mirrors and lenses can make objects look bigger or smaller. Concave mirrors and lenses can make objects look larger. Light rays from the object are reflected or refracted so that they focus at the focal point.

Convex Mirror

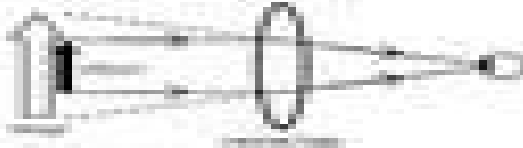

The convex mirror is curved outwards, making it diverge light.

The image is virtual, upright, and smaller than the object.

Lens

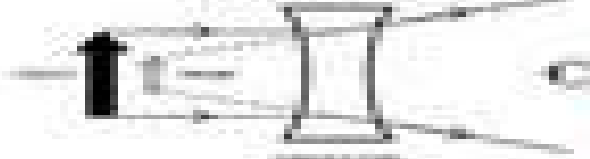

Lenses work by refraction, bending light rays so that they focus at a point.

A convex lens converges light.

A concave lens is divergent, spreading light rays out.

A concave lens diverges light.

A concave lens is divergent, spreading light rays out.

Image is virtual and upright.

Concave and convex lenses converge or diverge light. If the object is at the focal point, there is no image formed.

Concave Lens

Optical System

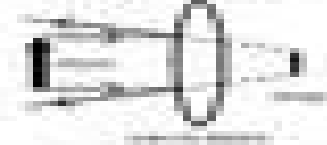

Optical systems can be used to focus light, create images, and control the direction of light. They are used in many applications, including cameras, telescopes, and microscopes.

Image

Image is a representation of an object. It can be real or virtual, upright or inverted, and magnified or reduced.

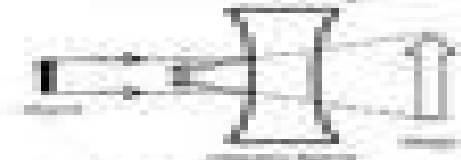

For the image to be real, the object must be placed beyond the focal point of the lens.

A convex lens converges light.

A convex lens is convergent.

A concave lens diverges light.

A concave lens is divergent.
