A Hypothetical Enhanced Renewable Energy Utilization (EREU) Model for Electricity Generation in Thailand Thomas Andexer, 2008 Master's Thesis from the year 2008 in the subject Environmental Sciences grade Passed Assumption University of Thailand College of Internet Distance Education CIDE School of Business Administration course Master Thesis Project 100 entries in the bibliography language English abstract This thesis presents a research project entitled A Hypothetical Enhanced Renewable Energy Utilization EREU Model for Electricity Generation in Thailand This research is motivated by Thailand's rapidly increasing electricity consumption caused by the country's long standing above average economic growth Consequently the rising electricity demand can only be satisfied by continuously growing electricity imports and thus creating a significant burden to Thailand's national budget Further more Thailand is heavily dependent on natural gas reserves for electricity generation however these are expected to be depleted within only three decades and global price levels for conventional fuels are increasingly volatile with an ascending tendency as well Therefore Thailand faces an urgent need to strategically plan for the broad utilization of domestic renewable energy resources which is essential for a more diversified and thus sustainable electricity generation as well as for the nation's endeavor to become an energy hub within the South East Asian region Under these circumstances this research conducts a comprehensive literature review regarding the past development as well as the current situation of renewable energy utilization in Thailand which concludes in the identification of the importance of renewable energy in the given context and closes with both a distinctive need assessment and a conceptual framework for Thailand's future renewable energy strategy Subsequently the research introduces a unique primary research endeavor in the form of an explorative expert interview survey which succeeds in a substantial collection of qualitative and in depth

Quantitative Conservation of Vertebrates Michael J. Conroy, John P. Carroll, 2011-09-20 This book provides a hands on introduction to the construction and application of models to studies of vertebrate distribution abundance and habitat The book is aimed at field biologists conservation planners and advanced undergraduate and postgraduate students who are involved with planning and analyzing conservation studies and applying the results to conservation decisions The book also acts as a bridge to more advanced and mathematically challenging coverage in the wider literature Part I provides a basic background in

population and community modeling It introduces statistical models and familiarizes the reader with important concepts in the design of monitoring and research programs These programs provide the essential data that guide conservation decision making Part II covers the principal methods used to estimate abundance occupancy demographic parameters and community parameters including occupancy sampling sample counts distance sampling and capture mark recapture for both closed and open populations Emphasis is placed on practical aspects of designing and implementing field studies and the proper analysis of data Part III introduces structured decision making and adaptive management in which predictive models are used to inform conservation decision makers on appropriate decisions in the face of uncertainty with the goal of reducing uncertainty through monitoring and research A detailed case study is used to illustrate each of these themes Numerous worked examples and accompanying electronic material on a website <http://www.blackwellpublishing.com/conroy> and accompanying CD provide the details of model construction and application and data analysis
