

Earth

by Cynthia Sherwood

Earth is the "just right" planet. It's not too close to the sun and it's not too far away. That means Earth doesn't get too hot or too cold, unlike all the other planets. Because of its comfortable temperatures, Earth is the only place in the entire universe where we know that life exists. That makes Earth very special!

Earth is unique in another way too. Living creatures must have water to survive. Since water covers about seventy percent of Earth's surface, our planet is an ideal place to support life in many different forms. The rest of Earth's surface is made up of seven land masses called continents.

Scientists say Earth is about four-and-a-half billion years old. Fossils show microscopic life first appeared about a billion years later. Evidence of the first human beings came much later—only about 200-hundred-thousand years ago. That's many millions of years after the dinosaurs became extinct.

Earth is the fifth largest planet and the third planet from the sun, which is about 93 million miles away. It takes one year for Earth to travel completely around the sun. Earth also spins around like a top, going about a thousand miles an hour. You'd think we'd all need seat belts! Earth rotates around like this once every twenty-four hours, and that's what gives us night and day.

Earth is divided into several layers: the top part is called the crust, the part below that is called the mantle, and the part in the center is called the core. The core is solid and is probably made up of iron. Temperatures at the center of the core may be even hotter than the surface of the sun!

Scientists who study Earth are called geologists. Astronauts can also study Earth from space, adding to what we know about our unique and beautiful blue and green planet. Don't you feel lucky to live on the "just right" planet?
