Abdel-Mohsen O. Mohamed, Evan K. Paleologos, Fares Howari, 2020-10-25 Pollution Assessment for Sustainable Practices in Applied Sciences and Engineering provides an integrated reference for academics and professionals working on land air and water pollution. The protocols discussed and the extensive number of case studies help environmental engineers to quickly identify the correct process for projects under study. The book is divided into four parts each of the first three covers a separate environment: Geosphere, Atmosphere, and Hydrosphere. The first part covers ground assessment, contamination, geo statistics, remote sensing, GIS, risk assessment, and management and environmental impact assessment. The second part covers atmospheric assessment topics including the dynamics of contaminant transport, impacts of global warming, indoor and outdoor techniques, and practice. The third part is dedicated to the hydrosphere including both the marine and fresh water environments. Finally, part four examines emerging issues in pollution assessment from nanomaterials to artificial intelligence. There are a wide variety of case studies in the book to help bridge the gap between concept and practice. Environmental Engineers will benefit from the integrated approach to pollution assessment across multiple spheres. Practicing engineers and students will also benefit from the case studies which bring the practice side by side with fundamental concepts. Provides a comprehensive overview of pollution assessment. Covers land, underground water, and air pollution. Includes outdoor and indoor pollution assessment. Presents case studies that help bridge the gap between concepts and practice.

**Geotechnical and Geophysical Site Characterization** António Viana da Fonseca, Paul W. Mayne, 2004. Soils and rocks are complex natural geomaterials that exhibit a wide range in strength, stiffness, state of stress, structure, and flow characteristics. Geotechnical Geophysical Site Characterization provides eleven keynote state of the art papers including the Mitchell Lecture. A total selection of 219 technical papers and theme reports address methods of site exploration related to ground exploration for civil engineering and construction works. These two volumes represent a collection of experience, knowledge regarding various methods of in situ testing, geophysical techniques, innovative devices, improved interpretation, algorithms, and statistical treatment of field data for the characterization of soils, rocks, and other geomaterials. The papers represent the written records and documented efforts from international experts from industry, academe, and government who participated in the Second International Conference on Site Characterization held in Porto, Portugal, on September 20-22, 2004. Topics include the utilization of rotary drilling, sampling, and coring techniques. Of particular interest is the variety of in situ tests including standard penetration, cone penetration, flat dilatometer, pressuremeter, vane shear, piezocone, dynamic probes, and specialized tools, as well as geophysical approaches: resistivity surveys, surface waves, crosshole, downhole, electromagnetic conductivity, and ground penetrating radar. A careful and proper site evaluation is required in the analysis and design of new structures, construction monitoring, and forensic studies that require remediation. Many of the contributions relate to case studies of projects that involve shallow foundations, drilled shafts, pileings, slope stability, excavations, earth dams, tunnels, and mining. Several papers discuss a combined approach using multiple methods and or

complementary set of geotechnical geophysical tests to ascertain the characteristics of the ground back cover
