Math Horizons , 1993 *Digital Image Quality in Medicine* Oleg S. Pinykh, 2013-10-21 Making a good diagnostic image is only the beginning keeping it good and diagnostically sound is a much more difficult proposition one that is often neglected or forgotten by clinical practitioners

With anything digital the assumption of persistent original quality opens a Pandora's box of medical fiascos. Poorly selected image interpolation thoughtlessly used compression confused image enhancement options and the like can transform a good original into a useless clutter of pixels. This book is dedicated to learning better options. Intended for physicians, clinical practitioners and applications specialists, it provides a well rounded introduction to meaningful diagnostic image housekeeping. The book presents the most important aspects of safe digital image workflows starting from the basic practical implications and gradually uncovering the underlying concepts and algorithms. With an easy to follow down to earth presentation style, the text helps you to optimize your diagnostic imaging projects and connect the dots of medical informatics.

Kenneth Tan, 2016-04-07 The LNCS journal Transactions on Computational Science reflects recent developments in the field of Computational Science, conceiving the field not as a mere ancillary science but rather as an innovative approach supporting many other scientific disciplines. The journal focuses on original high quality research in the realm of computational science in parallel and distributed environments encompassing the facilitating theoretical foundations and the applications of large scale computations and massive data processing. It addresses researchers and practitioners in areas ranging from aerospace to biochemistry, from electronics to geosciences, from mathematics to software architecture, presenting verifiable computational methods, findings and solutions, and enabling industrial users to apply techniques of leading edge large scale high performance computational methods. This, the 27th issue of the Transactions on Computational Science journal, is devoted to the topic of high performance computing. It contains eight full papers covering the areas of cloud middleware, multi processor systems, quantum computing, optimization and secure biometric based encryption methods. **Readings in Computer Vision**

Martin A. Fischler, Oscar Firschein, 2014-06-28 The field of computer vision combines techniques from physics, mathematics, psychology, artificial intelligence and computer science to examine how machines might construct meaningful descriptions of their surrounding environment. The editors of this volume, prominent researchers and leaders of the SRI International AI Center Perception Group, have selected sixty papers most published since 1980 with the viewpoint that computer vision is concerned with solving seven basic problems: Reconstructing 3D scenes from 2D images; Decomposing images into their component parts; Recognizing and assigning labels to scene objects; Deducing and describing relations among scene objects; Determining the nature of computer architectures that can support the visual function; Representing abstractions in the world of computer memory; Matching stored descriptions to image representation. Each chapter of this volume addresses one of these problems through an introductory discussion which identifies major ideas and summarizes approaches and through

reprints of key research papers Two appendices on crucial assumptions in image interpretation and on parallel architectures for vision applications a glossary of technical terms and a comprehensive bibliography and index complete the volume
