Control Grid Motion Estimation for Efficient Application of Optical Flow Christine M. Zwart, David Frakes, 2022-05-31
Motion estimation is a long standing cornerstone of image and video processing. Most notably motion estimation serves as the foundation for many of today's ubiquitous video coding standards including H.264. Motion estimators also play key roles in countless other applications that serve the consumer, industrial, biomedical, and military sectors. Of the many available motion estimation techniques, optical flow is widely regarded as most flexible. The flexibility offered by optical flow is particularly useful for complex registration and interpolation problems but comes at a considerable computational expense. As the volume and dimensionality of data that motion estimators are applied to continue to grow, that expense becomes more and more costly. Control grid motion estimators based on optical flow can accomplish motion estimation with flexibility similar to pure optical flow but at a fraction of the computational expense. Control grid methods also offer the added benefit of representing motion far more compactly than pure optical flow. This booklet explores control grid motion estimation and provides implementations of the approach that apply to data of multiple dimensionalities. Important current applications of control grid methods including registration and interpolation are also developed. Table of Contents: Introduction, Control Grid Interpolation, CGI Application of CGI to Registration Problems, Application of CGI to Interpolation Problems, Discussion and Conclusions.

Detection of Melt Ponds on Arctic Sea Ice with Optical Satellite Data Anja Rösel, 2013-05-23
The Arctic sea ice is characterized by profound changes caused by surface melting processes and the formation of melt ponds in summer. Melt ponds contribute to the ice albedo feedback as they reduce the surface albedo of sea ice and hence accelerate the decay of Arctic sea ice. To quantify the melting of the entire Arctic sea ice, satellite based observations are necessary. Due to different spectral properties of snow, ice, and water, theoretically multi-spectral optical sensors are necessary for the analysis of these distinct surface types. This study demonstrates the potential of optical sensors to detect melt ponds on Arctic sea ice. For the first time, an Arctic wide multi-annual melt pond data set for the years 2000-2011 has been created and analyzed.

Pan-Arctic Perspective of the Contemporary and Future Arctic Ocean Paul F. J. Wassmann, Dorte

Krause-Jensen, Markus A. Janout, Bodil Annikki Bluhm, 2021-08-25 The Topic Editors Paul F J Wassmann Dorte Krause Jensen Markus A Janout and Bodil Annikki Bluhm declare that they are collaborating with pan arctic community [The Atmosphere over Mountainous Regions](#) Miguel A. C. Teixeira, Daniel J. Kirshbaum, Haraldur Ólafsson, Peter F. Sheridan, Ivana Stiperski, 2016-11-09 Mountainous regions occupy a significant fraction of the Earth's continents and are characterized by specific meteorological phenomena operating on a wide range of scales. Being a home to large human populations, the impact of mountains on weather and hydrology has significant practical consequences. Mountains modulate the climate and create microclimates; induce different types of thermally and dynamically driven circulations; generate atmospheric waves of various scales known as mountain waves and affect the boundary layer characteristics and the dispersion of pollutants. At the local scale, strong downslope winds linked with mountain waves such as the Föhn and Bora can cause severe damage. Mountain wave breaking in the high atmosphere is a source of Clear Air Turbulence and lee wave rotors are a major near surface aviation hazard. Mountains also act to block strongly stratified air layers leading to the formation of valley cold air pools with implications for road safety, pollution, crop damage, etc. and gap flows. Presently, neither the fine scale structure of orographic precipitation nor the initiation of deep convection by mountainous terrain can be resolved adequately by regional to global scale models requiring appropriate downscaling or parameterization. Additionally, the shortest mountain waves need to be parameterized in global weather and climate prediction models because they exert a drag on the atmosphere. This drag not only decelerates the global atmospheric circulation but also affects temperatures in the polar stratosphere which control ozone depletion. It is likely that both mountain wave drag and orographic precipitation lead to non-trivial feedbacks in climate change scenarios. Measurement campaigns such as MAP T REX, Matterhorn COLPEX and iBox provided a wealth of mountain meteorology field data which is only starting to be explored. Recent advances in computing power allow numerical simulations of unprecedented resolution e.g. LES modelling of rotors, mountain wave turbulence and boundary layers in mountainous regions. This will lead to important advances in understanding these phenomena as well as mixing and pollutant dispersion over complex terrain or the onset and breakdown of cold air pools. On the other hand, recent analyses of global circulation biases point towards missing drag especially in the southern hemisphere which may be due to processes currently neglected in parameterizations. A better understanding of flow over orography is also crucial for a better management of wind power and a more effective use of data assimilation over complex terrain. This Research Topic includes contributions that aim to shed light on a number of these issues using theory, numerical modelling, field measurements and laboratory experiments.
