Internet Protocol 6 Julie C. Gaffin, 2007 The Internet Protocol IP is an international communications standard that is essential to the operation of both the public Internet and many private networks in existence today IP provides a standardised envelope that carries addressing routing and message handling information thereby enabling a message to be transmitted from its source to its final destination over the various interconnected networks that comprise the Internet The current generation of IP version 4 IPv4 has been in use for more than 20 years and has supported the Internet s rapid growth during that time With the transformation of the Internet in the 1990s from a research network to a commercialised network concerns were raised about the ability of IPv4 to accommodate anticipated increasing demand for Internet addresses In 1993 the Internet Engineering Task Force IETF began a design and standardisation process to develop a next generation Internet Protocol that would address among other issues

the predicted exhaustion of available IPv4 addresses The resulting set of standards collectively known as IP version 6 IPv6 was developed over the course of several years IETF a stable core of IPv6 protocols emerged by 1998 This book examines the technical and economic issues related to IPv6 adoption in the United States including the appropriate role of government international interoperability security in transition and costs and benefits of IPv6 deployment *Simplicity Marketing*
