By David W. Rye
David W. Rye, P.E., is a senior fire protection engineer at the University of Maryland System.

Fire hazard analysis is a systematic process for identifying, evaluating, and controlling fire hazards. It is a critical component of fire protection engineering and is used to assess the fire risk of a building or facility. The process involves a systematic review of the building's design, construction, and operation to identify potential fire hazards and evaluate the likelihood of their occurrence. The results of the analysis are used to develop fire protection measures to reduce the fire risk.
