Predicting Solder Defects in Printed Circuit Board Assembly (PCBA) Process Andrew Wallace Foster, 2019 Printed circuit boards PCBs are core components of virtually every modern electronic device from smartphones to servers Accordingly printed circuit board assembly PCBA has become core to Flex a leading electronics manufacturing services EMS company As the EMS industry continues to automate the PCBA process it captures more data and creates opportunities to leverage this data and to generate value through analytics One such promising opportunity is using defect prediction to improve downstream yields For instance x ray inspection which mostly detects solder defects has a yield of about 97% for one of Flex's automated PCBA lines and an improvement even to just 98% would create significant cost savings Given this opportunity this project aims to use the new data captured by the first steps in the automated PCBA process to predict solder defects that are usually identified during inspection several days after the board begins the PCBA process Specifically the proposed boosted trees model uses data on 20 000 solder pads to predict whether an entire board will fail a downstream x ray test Other more granular models are also studied as well as other predictive models such as logistic regression and convolutional neural network models The model is able to identify defective PCBs with an AUC of 0.74 and improve x ray inspection yields from 97% to 98% using one PCBA line at Flex as a case study A second additional use case would reduce the number of x ray inspection machines needed Furthermore a pilot implementation demonstrated that the model works well enough to enable these savings to be realized in practice At the site where this study was conducted these two use cases are estimated to produce significant savings over the seven year useful life of the PCBA machinery Since Flex has over 1 500 PCBA sites the results of this case study suggest that there is potential to scale these analytics and related savings across the company

**Printed circuit board (PCB) - the base of each Electronic Product** RATAN SENGUPTA, 2023-06-06. Though the base of each electronic product is a printed circuit board (PCB), little stress is given to understand their composition and properties.

Printed Circuit board acts as base for physically supporting and wiring the Electronic components in most electronics PCB or Printed Circuit Board is the traditional name for the bare board with the layout data and which you use to mount your components on once we have delivered it to you A printed circuit board or PCB is used to mechanically support and electrically connect electronic components using conductive pathways PCBs can be single layer for simple electronic devices Printed circuit boards for complex hardware such as computer graphics cards and motherboards may have up to twelve layers A PC board can have conductors on one side or two sides and can be multi layer a sandwich with many layers of conductors each separated by insulating layers The most common circuit boards are made of plastic or glass fiber and resin composites and use copper traces but a wide variety of other materials may be used Most PCBs are flat and rigid but flexible substrates can allow boards to fit in convoluted spaces Components are mounted via SMD surface mount or through hole methods Customs Bulletin ,2000-06 China Ross Garnaut,Jane Golley,Ligang Song,2010-07-01 China has made some remarkable achievements during the first three decades of economic reform and opening up rising to become one of the world s most dynamic and globally integrated market economies Yet there remains much unfinished business on the reform and development agenda coupled with newly emerging challenges CHINA THE NEXT TWENTY YEARS OF REFORM AND DEVELOPMENT highlights how the deepening of reforms in critical areas such as domestic factor markets the exchange rate regime and the health system combined with the strengthening of channels for effective policy implementation will enable China to cope with the challenges that lie ahead These include responding to the pending exhaustion of the unlimited supply of labour playing a constructive role in reducing global trade imbalances enhancing firms ability to innovate coping with migration urbanisation and rising inequalities on scales unknown in world history and dealing with rising energy and metal demand in an era in which low carbon growth has become a necessity rather than a choice **Official Gazette of the United States Patent and Trademark Office** United States.
