Dynamic Modeling and Predictive Control in Solid Oxide Fuel Cells Biao Huang, Yutong Qi, A. K. M. Monjur Murshed, 2013-02-18 The high temperature solid oxide fuel cell SOFC is

identified as one of the leading fuel cell technology contenders to capture the energy market in years to come. However, in order to operate as an efficient energy generating system, the SOFC requires an appropriate control system which in turn requires a detailed modelling of process dynamics. Introducing state of the art dynamic modelling, estimation and control of SOFC systems, this book presents original modelling methods and brand new results as developed by the authors. With comprehensive coverage and bringing together many aspects of SOFC technology, it considers dynamic modelling through first principles and data based approaches and considers all aspects of control including modelling, system identification, state estimation, conventional and advanced control. Key features: Discusses both planar and tubular SOFC and detailed and simplified dynamic modelling for SOFC. Systematically describes single model and distributed models from cell level to system level. Provides parameters for all models developed for easy reference and reproducing of the results. All theories are illustrated through vivid fuel cell application examples such as state of the art unscented Kalman filter model, predictive control and system identification techniques to SOFC systems. The tutorial approach makes it perfect for learning the fundamentals of chemical engineering, system identification, state estimation and process control. It is suitable for graduate students in chemical, mechanical, power and electrical engineering, especially those in process control, process systems engineering, control systems or fuel cells. It will also aid researchers who need a reminder of the basics as well as an overview of current techniques in the dynamic modelling and control of SOFC.

Applications in Bioprocess Engineering A.R. Moreira, Kimberlee K. Wallace, 2012-12-06. Biotechnology has been labelled as one of the key technologies of the last two decades of the 20th Century, offering boundless solutions to problems ranging from food and agricultural production to pharmaceutical and medical applications, as well as environmental and bioremediation problems. Biological processes, however, are complex and the prevailing mechanisms are either unknown or poorly understood. This means that adequate techniques for data acquisition and analysis, leading to appropriate modeling and simulation packages that can be superimposed on the engineering principles, need to be routine tools for future biotechnologists. The present volume presents a masterly summary of the most recent work in the field, covering instrumentation systems, enzyme technology, environmental biotechnology, food applications and metabolic engineering.
